# Cocker's

BEINGL

A Plain and familiar Method. Suitable to the meanest Capacity for the full under standing of that Incomparable Art, as it is now taught by the ablest School-masters in City and Country.

COMPOSED

By Edward Cocker, late Practitioner in the Arts of Writing, Arithmetick, and Engraving. Being that to long fince promifed to the World.

PERUSED and PUBLISHED

By John Hawkins, Writing Master near St. George's Church in Southwark, by the Anthor's correct Copy, and commended to the World by many eminent Mathematicians and Writing Masters in and near London.

The Thirty firth Edition carefully Con-

Licensed Sept. 3: 1677. Roger L'ftrange.

Printed for H. Tracy, at the Three B. London-Bridge. 1719.

# To the READER Courteous Reader, READER

HAVING had the Happiness of a intimate Acquaintance with Mr Cock in his Life-time, often folicited him remember his Promise to the World, of Pub lishing his Arithmetick; but (for Reasons be known to himself) he refus'd it; and (after his Death) the Copy falling accidentally int my Hands; I thought it not convenient to Imother a Work of so considerable a Momen not questioning but it might be as kindly at cepted, as if it had been presented by his ow Hand. The Method is familiar and easy, dil covering as well the Theorick as the Practic of that Necessary Art of Vulgar Arithmetick And in this new Edition there are many re markable Alterations for the Benefit of the Teacher or Learner, which I hope will be very acceptable to the World: I have all perform'd my Promise in publishing the Deci mal Arithmetick, which finds Encouragement to my Expectation, and the Bookfellers too I am

Thine to Serve thee,

### PROEME or PREFACE.

BY the sacred Influence of Divine Providence,
I have been instrumental to the Benefit of
many by Vertue of those useful Arts, Writing
and Engraving: And do now with the same wonted Abacrity cast this my Arithmetical Mite into
the publick Treasury, beseeching the Almighty to
grant the like Blessing to these as to my former
Labours.

Are the chief Stars in Wisdom's Firmament:
Whereof Arithmetick is one, whose Worth
The Beams of Profits and Delights shine forth;
This crowns the rest, this makes Man's Mind compleat;

This treats of Numbers, and of this we treats

I have been often desir'd by any intinate Friends to Publish Something on this Subject; who in a pleasing Freedom have signify'd to me, That they expected it would be extraordinary. How far I have answer'd their Expectation, I know not; but this I know, That I have designed this Work not extraordinary abstruct or profound a

#### The Proeme or Preface,

found; but have by all Means possible within the Circumference of my Capacity, endeavour'd to render it extraordinary weeful to all those, whose Occasions shall induce them to make use Numbers. If it be objected, That the Books al-ready published, treating of Numbers, are innumerable, I answer, That's but a Small Wonder, since the Art is infinite. But that there should be so many excellent Tracts of Practical Arithmetick extant, and so little practis'd, is to me a greater Wonder; knowing that as Merchandize is the Life of the Weal-Publick, fo L Practical Arithmetick is the Soul of Merchanft dize. Therefore I do ingenously profess, That in the Beginning of this Undertaking, the numens, ns, rous Concerns of the bonoured Merchant first pos-Affiche my Confideration : And bow far I bove ofed accomodated this Composure for his most worth Elve. Service, let his own profitable Experience be ingen judge. rope

Secondly, For your Services, most excellent rs, Professors, whose Understandings soar to the eliversublimity of the Theory and Practice of this synt Noble Science, was this Arithmetical Tractate ick Composed; which you may please to imploy as a dised Monitor to instruct your young Tyroes, and e conthereby take Occasion to reserve your precious re go Moments, which might be exhausted that Way, incer for your more important Affairs.

#### CHAP. I.

#### Notation of Numbers.

Rithmetick is an Art of Numbering or Knowledge, which teacheth to Number well,
(wiz.) the Doctrine of Accounting by
Numbers. And there are divers Species and
Kinds of Arithmetick and Geometry, the
hich we do intend to treat of in order; applying the
rinciples of the one to the Definition of the other,
or as Magnitude or Greatness is the Subject of Geoetry, fo Multitude or Number is the Subject of
rithmetick; and if so, then their first Principles and
hief Fundamentals, must have like Definitions; or at
ast, a semblable Congruency.

2. Number is that, by which the Quantity of any sing is express'd or numbred; as the Unit is the sumber by which the Quantity of the Thing is express'd or said to be one, and two by which it is nam'd wo, and \frac{1}{2} half, by which it is nam'd or called half, and the Root of 3 by which it is called the Root of 3.

e like of any other.

3. Hence it is that Unit is Number; for the part is the same Matter that is his whole, the Unit is not of the Multitude of Units, therefore the Unit is the same Matter that is the Multitude of Units; it the Matter of the multitude of Units is Number, erefore the Matter of Unit is Number; for elle it om a Number given no Number be subtracted, the umber given remaineth; let three be the Number ginn; from which Number subtract or take away one, thich as some conceive, is no Number) therefore the

В

Number given remaineth, that is to fay, there remain.

oth three, which is abfurd.

4. Rence it will be convenient to examine from whence Number hath its Rife or Beginning. Most Authors maintain, That Unit is the Beginning of Number and itself no Number, but looking upon the Principal ples and Definitions in the first Rudiments of Geome try, we shall find that the Definition of a Point is in no way congruous with the Definition of an Unit in Arithmetick; and therefore One or Unit must be in the Bounds or Limits of Number, and confequently the Beginning of Number is not to be found in the Number One; wherefore we make Number and Magnieude congruent in Principles, and like in Definition we make and constitute a Cypher to be the Beginning of Number, or rather the Medium between increasing and decreasing Numbers, commonly call'd absolute of whole Numbers, and negative or fractional Numbers between which Nothing can be imagin'd more agree able to the Definition of a Point in Geometry; for an Point is an Adjunct of a Line, and itself no Line, so is (o) Cypher an Adjunct of Number, and itself no Num ber : And as a Point in Geometry cannot be divided increas'd into Parts; so likewise (o) cannot be divide or increas'd into Parts : For, as many Points, though number infinite, do make no Line, fo many (o) Cy phers, though in number infinite do make no Number. For the Line AB cannot be increased by the Addition of the Point C, neither can the number D be increased by the of the (o) Cypher E, Addition nor if you add Nothing to 6, the Sum Sum will be 6, a (0) Cypher neither encreasing or diminishing the Number 6; but if it be granted that DE 760 B be extended or prolonged to the Point C. fo, that A C be made s continu'd Line, then A B is increafed by the Addition of the Point C. f we grant D (6) be prolong'd to E (e) fo that D E (60) be a continu'd Number making 60, then 6 is augmented by the Aid of (o) as the constituting the Numer (60) fixty; and furthermore that One or Unit is material and a Number, and that (o) is the Beginning of Number, is prov'd by all Authors, altho' directly; or the Tables of Sines and Tangents prove one Deree to be a Number, because the Sine of 1 Degree is 74524 (the Radius being 10000000) and the Beginning of that Table is (o) and it answereth ocooo, &c. 5. Hence it is that Number is not Quantity difcontinu'd, for all that which is but one Quantity, is not Quantity disjunct, (60) fixty as it is a Number, is one Quantity, viz. one Number (60) fixty; thereore as it is Number, it is not Quantity disjunct; for Number is some such Thing in Magnitude, as Humility in Water; for as Humidity extends itself through il and every Part of Water, so Number related to Magnitude, doth extend itself through all and every Part of Magnitude. Also, as to continu'd Water doth nswer continu'd Humidity, so to a continu'd Magniude doth answer a continu'd Number. As the centinued Humidity of any intire Water, suffereth the ame Division and Distinction that his Water doth : So de he continu'd Number Suffereth the same Division and Distinction that his Magnitude doth. From all which Cy Considerations we might inlarge a farther Digression oncerning Number and Magnitude, by comparing he Definitions of the one with the Principles of the other; for having found a (o) Cypher to be the Anwer in the Definition to a Point in Magnitude, we nay very well sonclude that Number may be congruent to a Line: as also the figurative Number to be confo nant in Definition with a Superficies and So-

id, &c. in the Order of Geometrical Magnitudes. 6 The Character, or Notes by which Numbers are ignify'd or by which a Number is ordinarily express'd re these following, viz, o Cypher or Nothing, I One, Two, 3 Three, 4 Four, 5 Five. 6 Six, 7 Seven, Eight, o Nine. The Cypher, which though of it-

tight

nd do

Telf it fignifies nothing, wis. expresset not any centrain or known Quantity, yet is the sleginning, Radix or Root of Number, and the other nine Figures of Characters, are call'd significant Figures or Digits.

y. In Numbers of any fort, two Things are to be com

Rder'd, viz. Notation and Numeration:

8. Notation teacheth how to describe any Number by certain Notes and Characters, and to declare the Value thereof being so describ'd, and that is by Dgreet and Periods.

9. A Degree confifts of three Figures, v/z. of three Places, comprehending Units, Tens and Hundreds is 365, is a Degree, and the first Figure (5) on the right Hand, stands simply for his own Value, being sUnits, or so many Ones, v/z. Five; the second in order from the Right, signifies as many times Ten, as there are Units contain'd in it, v/z, sixty; the third in the same order signifies so many Hundreds as it contains Units, so will the expression of the Number be Three hundred sixty sive, also 789, is Seven hundred eighty mine,  $\delta v$ .

to. A Period, is when a Number confilts of months three Figures or Places, and whose proper Order is to prick or distinguish overy third place, beginning at the Right Hand, and so on to the Left; so the Number 63452 being given, it will be distinguish's thus, 63.452, and expressed thus, Sixty three thousand, four hundred sitty two; likewise 4.578.236.781 being distinguish'd as you see, will be express'd thus Four thousand, sive hundred seventy eight Millions two hundred thirry six thousand, seven hundred

eighty two.

11. Number: is either Absolute or Negative.

ber, is that which by annexing another Figure or Cypher, it becomes ten times as much as it flood for before; and if two Figures or Cyphers he annex'd, it makes an hundred times as much as it flood for before, &c. As if you annex to the Figure 6 a Cypher then it will become (60) fixty; so if two Cyphers an annex'd.

nex'd

nnexed, then Iz will be (600) fix hundred, and if your to annex to it a (4) four, then it will be (64) fixty four; and if you annex (78) feventy eight, it will be then (678) fix hundred feventy eight, and fo on. By annexing more Figures or Cyphers, it will increase in

decuple proportion ad infinitum.

13. A Negative or Broken, Fractional, Decreafing Number, is that which by prefixing a Point or Price towards the Left Hand, its Value is decreased from for many Units, to fo many teach parts of any Thing, and If a Point and (o) Cypher, or Digit be perfix'd, ie will be then fo many hundred parts, and if a Point and two Cyphers or Digits be putfix'd, its Value is decreafed to be fo many thousandth parts, as if you would prefix before the Figure ; a Point () or Prick thus (3) it is then decreased from & Units or & Integers, tothree tenth parts of an Unit or Integer . And if you prefix an Unit and Cypher thus (.03) it is degreated rom 1 Integers to 3 hundred parts of an Integer, and by this Means 5 1. absolute, by prefixing of a Point will be decreased to, 55 / negative, which is 5 tenths parts of a Pound, equal in Value to ten Shillings ; and by prefixing of more Cyphers or Digits, its Value s decreased in a decuple proportion ad infinitum. n the following Scheme, or rather Order of Numbers, we have placed (o) Cypher in its due Place and Order sitisinthe Beginning and Medium of Number; foregoe ng from (o) towards the Left Hand you deal with ntire, absolute, whole, increasing Numbers:

Increasing	N	mbers			Decre	a fing	Numbe	**
25 876 mmm mmm mmm mmm mmm mmm mmm mmm X CX	543 mmm mmm CX	256 mmm	CXU	XC	345 mmm XC	078 mmm	mmm mmm mmm XCX	30000

But going from (c) the place of Units rowards the tight Hand, you meet with broken, negative Fractions and decreasing Numbers. And hence it follows that B. 3

Fractional Numbers.

14. An absolute, entire, whole, increasing Number, hath always a Point annex'd towards the Right Hand; and therefore,

ber, hath always a Point prefix'd before it towards the Left Hand. When we express Integers or whole Numbers, as 5 Pounds, 5 Feet, 26 Men, we usually annext

Point or Prick after the Number thus, 4, 5, 26, 347. But when we express Decimals, or Numbers that are deny'd to be entire, as decreasing Numbers, we do commonly press a Point or Prick before the said Decimal or decreasing Number, thus (.3) that is three tenths or 3 primes; (.03) that is 3 hundredths, or 3 seconds.

16. A whole or absolute Number is an Unit, or composed Multitude of Units, and it is either a prime

or elfe a compound Number.

17. Prime Numbers amongst themselves, are those which have no Multitude of Units for a common Measurer, as 8 and 7, and 10 and 13, because not any Multitude of Units can equally measure or divide them without a Remainder.

18. Compound Numbers amongst themselves and those which have a Multitude of Units for a common Measurer, as 9 and 12, because 3 measures them ex

actly, and abreviates them to 3 and 4.

is a part or parts of a whole Number, viz. a part of a Integer, as 1 one third, is one third part of an Unit.

20. A broken Number or Fraction, confifts of 2 parts

viz. the Numerator and Denominator.

are set one over the other, with a Line between them and the Numerator is set above the Line, and expresent the parts therein contain'd.

. Th

22. The Denominator of a Fraction, is the inferior Number plac'd below the Line, and expresseth the Numper of Parts into which the Unit or Integer is divided: s let 3 be the Fraction given, fo fhall 3 be the Numester, and doth express or number the Multitude of Parts contain'd in this Fraction, for is a Fraction compounded of Fourths or Quarters; and the Figure 2 n numbring shews us, that in that Fraction there are Three of those Fourth Parts or Quarters; also in the fame Fraction 3, 4 is the Denominator, and doth express. the quality of the Frattion, viz. that the whole or Inreger is here divided into 4 equal Parts.

23. A Broken Number, is either proper or improper viz. proper when the Numerator is less then the Denominator, for 3 is a perfect proper Fraction, but an improper Fraction hath its Numerator greater or at least equal to the Denominator; thus 'I is an improper Fraction, the

Reason is given in the Definition.

24. A proper Broken Number, is either Simple of Come pound, viz. Simple, when it hath one Denomination. and Compound, when it consisteth of divers Denominations. If  $\frac{3}{4}$ ,  $\frac{6}{12}$ ,  $\frac{3}{16}$ , were given, we fay, they are each of them Single or Simple Frations, because they confift but of one Numerator, and one Denominator; but if & of 2 of a Pound Sterling were given, we fay, that is a Compound Broken Number or Fraction, because the Expression and Representation consisteth of more Denominations than one; and fuch by some are call'd Fractions of Fractions, they have always this Particle (of) between them.

25. When a fingle Broken Number or Fraction hath for his Denominator a Number confisting of an Unit in the first Place toward the left Hand, and nothing but Cyphers from the Unit toward the Right Hand, it is then the more aptly and tightly call'd a Decimal Fraction, under this Head are all our Decreasing Numbers placed, and in our 13th Definition, call'd Negatives, and by that Order there prescrib'd, we order them to be Deeimals, by figning a point or prick before them, or the Numerator, rejecting the Denominator, Therefore according

B.4

cording to our last Rule, To Tit Tit, are said to be Decimals; and a Decimal Fraction may be expresse without its Denomination (as before) by perfixing Point or Prick before the Numerator, of the said Fraction and then shall the former Fractitions Tiv and Tit stan

thus, .5, .05. and .025.

But oftentimes as in the fecond and fourth Profile 715 and 155 and a prick or point will not do without the Help of a Cypher or Cyphers prefix'd before the fignificant Figures of the Numerator, and therefore when the Numerator of a Decimal Fraction confifteth not of a many places as the Denominator hath Cyphers, fill up the void places of the Numerator, with prefixing Cyphers before the fignificant Figures of the Numerator, and then fign it for a Decimal, so shall 75; be .05 and 755 will be .025, and 75000 will be .0072. Now by this we may easily discover the Denominator having the Numerator; for always the Denominator of any Deckmal Fraction consists of so many Cyphers, as the Numerator hath places, with an Unit perfix'd before the said Cypher, viz. under the point or prick.

26. A Decimal Number or Fraction, is that which is express'd by Primes, Seconds, Thirds, Fourths, &c. and is Number decreasing. Here instead of Natural and Common Fractions, as \$\frac{1}{2}\$ of a Thing, we order the Thing or Integer into Primes, Seconds, Thirds, Fourths, Fifth &c. that our Expression may be consonant to our for

mer Order.

27. In Decimal Arithmetick we always imagine (and it would be very commodious if it were always for that all intire Units, Integers and Things are divided first into ten equal parts, and these parts so divided we call Primes; and secondly, we divide also each of the former Primes into other ten equal parts, and every of these Divisions we call Seconds; and thirdly, we divide each of the said Seconds into ten other equal parts, and those so divided, we call Thirds; and so by decimating the former, and sub-decimating these latter we run on ad Infinitum.

28. Let a Pound Sterling, Troy-weight, Averdupile weight,

Veight, Liquid- Meafure, Dry- Meafure, Long- Meafure, Timey burn, or any other Thing, or Integer be given to be cimally divided; In this Notion premited we ought lot the first Division be Primes, the next Division Seends, the next Thirds, &c. So one Pound Sterling beng to Shillings, which divided into ten equal parts, he value of each part will be 2 Shillings; cherefore ne Prime of a Pound Seerling will fand thus: (1.) which is in Value 2 Shillings; three Primes will stand hus; (3) and that is in Value 6 Shillings. Again, Prime or . 1 being divided into ten equal parts, each f these parts will be one Second, and is thus express'd, ou) and its Value will be found to be 2d. Farthing and of a Farthing; and fo will of fignify one Shilling, r have five Seconds. And if .or be divided into ten oher equal parts, each of those parts so divided will behirds and will stand thus, .oot, and its Value will be ound to be .90 of a Farthing or 25 of a Farthing, and pag Thirds will be ad and 64 of a Farthing, or to of a farthing, &c. So that 375 / will be found to repreent 7 s. 6 d. for the three Primes are 6 Shillings, and ho 7 Seconds are 1 s. 4 d sand - of a Penny, and the Thirds are a Penny, and to of a Penny, both which

21. If you put any Bulk or Body, representing and nteger, if it be decimally divided, then the parts in the uft Decimation are Primes, the next Seconds, and then ext Decimation is Thirds, the next Fourths, &c. As et there be given a Bullet of Lead, or fuch-like, whole Weight let it be 501. Troy, this call an Unit, Integer, or Thing; then will the like Weight and Matter, make 10 ther, the which together, will be equal to so I. and. will weigh each of them 5 l. spiece; take of the fame, Marter; and equal to 5 h make 10 more, then each of hole will weigh 6 Quinces apiece alfo, if again you. ake 6 Ounces, and thereof make 10 other fmall Bullets sch of them will weight 2 Penny-weight 700 and hus have you made Primes, Seconds, Thirds in respect fiche Integer, containing so ! Trey-weight; So that 5: rimes is equal to the half Male, and a Primes, and 5 See

dded together make 75. 6 d.

m

fo

Q

Vi

m

N

th

di

30

feconds is a quarter of the Mass; and therefore one of the first division, a of the second division, and s of the third division, will be equal in weight to \frac{1}{2} a quar-

ter of the Mass, and contains 6 l. 3 Ounces.

30. When a Decimal Fraction followeth a whole Number, you are to separate or part the Decimal from the whole Number by a point or prick; so if 75 followed the whole Number 32, set them thus, 32.75. You shall find that divers Authors have divers Ways in expressing mint Numbers, as thus, 32 25, or 32 25, or 32 75, but you will find that 32.75 thus placed and express'd is the fittest for Calculation.

31. A mint Number hath 2 parts the whole and the broken; the whole is that which is composed of Integers, and the broken is a Fraction annexed thereunto. So the mint Number 36 1/2 being given, we say, that 36 is the whole Number, which is composed of Integers, and the 1/2 is the broken Number annexed, which sheweth that one of the former Integers (of that 36) being divided into 10 parts, 1/2 doth express 8 of those 12 parts more, belonging to the said 36 Integers.

32. Denominative Numbers are of one, or of many, and those are of divers Sorts and Kinds, viz Singular, call'd Unit, as 1; and Plurel, called Multitude, as 2, 3, 4, 5; Single, of one Kind only, call'd Digits, as 1, 2, 3, 4, 5, 6, 7, 8, 9; and Compounds of many, 10, 11,

12, Oc. 102, 367, Oc.

Proportional, as Single, Multiple, Double, Triple, Quadruple, &c. Denominate, as Pounds, Shillings, Pence; Undenominate, as 1, 2, 3, &c. Perfect, as 6, 28, 496, 8128, 130816, 2096128, &c. whose parts are equal to the Numbers; Imperfect, unequal, and more than the Sum, as 12, to 1, 2, 3, 4, 6; Imperfect; unequal, and less than the Sum, as 8, to 1, 2, 4. Numbers Commensurable and Incommensurable, as 12 and 9 are Commensurable, because 3 measures them both; but 6 and 17 are Incommensurable, because no one common Number or Measure can measure them; Linear, an form of a Line, as ....... Superficial, in form of a Superficies or Plan, as ;;; or ; ; &c. and Number

ber cubical or solid in Form of a Cube. These two latter are otherwise called figurative Numbers: There are also other Numbers called Tabular, as Sines, Tangents, Secants, &c. Others that be called Logarithmetick, or borrowed Numbers, fitted to Proportion for each, and speedy Calculation of all manner of Questions.

#### CHAP. II.

Of the Natural Division of Integers, and the Several Denominations of the Parts.

BEFORE we come to Calculation or the orderating of Numbers to operate any Arithmetical Question proposed, we will lay down Tables of the Denomination of several Integers; and after that (having mention'd the several Species and Kinds of Arithmetick) we shall immediately handle the Species of Numeration; which are the main Pillars upon which the whole Fabrick of this Art is built.

#### Of Money, Weights, &c.

2. The least Denomination or Fraction of Money afed in England, is a Farthing, from whence is produced the following Table, call'd the Table of Coin, vizz

Standard. The Galdsmiths have divided the Ounce froy-weight in other parts, which they generally call Mark-weight; the denominative parts thereof are as followeth, wiz A Mark (being an Ounce Troy is die rided into 24 equal parts called Carees, and each Carees into 4 Grains, so that in a Mark are 96 Grains by this Weight they diftinguish the different finenels of their Gold; for if to the finenels of Gold be put a Caects of Alloy (which is of Silver, Copper, or other pafer Metal, with which they afe to mix their Gold or silver to abate the finenels thereof both making when old but an Ounce or 14 Carects, then this Gold is faid o be 22 Carects fine, for if it come to be refin'd the 2 Carects of Alloy will fly away, and leave only 22 Caects of pure Gold; the like to be consider'd of a greatr or leffer quantity; and as the finenels of Gold is effinated by Carects so the fineness of Silver is distinguish'd y Ounces; for if a Pound of it be pure and lofeth othing in the Refining, fuch Silver is faid to be twelve Dunces fine; but if it loseth any thing, it is faid to ontain so much fineness as the loss wanteth of 12 Dunces, as if it loft I Ounce 14 Penny-weight; then it faid to be 10 Ounces 6-Penny-weight fine, and that which loseth 2 Ounces 4 Penny-weight 16 Grains, is id to be o Ounces ry Penny-weight & Grains fine, Oc. he like of a greater or leffer quantity.

Of Apothecaries Weights.

4. The Apothecaries have their Weights deduc'd from oy-weight, a Pound Troy being the greatest Integer, Table of whose Division and Subdivision followeth,

s. Thui

dapeile-weight (I Pound of which is equal to 14 Ounce

12 Penny-weight Troy-weight) and it ferveth to weigh all kinds of Grocery-Wares, as also Butter, Cheefe, Flesh Wax, Tallow, Rofin, Pitch, Lead, and all fuch kind of Garble, the Table of which Weight is as followeth.

The Table of Averdupoife-Weight. 4 quarters of a dram ounse: 16 drams pound 16 ounces quarter of a hundred 28 pounds bundred weight at 112 4 quarters 20 bundred And therefore Turs.

drams. 975. -2240-35840-573440-2293760 - 112 - 1792 - 28672 - 114688 - 28 - 448 - 7168 - 28672 - 16 - 256 - 1024 - 16--

Wool is weighed with this Weight, but only the Divisions are not the same; A Table whereof followeth.

ATable of the denominative Parts of Wool-Weight. 7 pounds I clove 2 cloves 1 fone 2 ftones 6 todd I ftone 1 mey 2 meys 32 Jacks

The

8. The least denominative part of Long-mensure is a arly-corn well dried and taken out of the middle of he Ear; whose Table of parts followeth.

3 Barly-corns CI inch I foop 1 inches 3 feet I yard 3 feet 9 inches, or # ? I ell Englis yard and a quarter \$ > 6 feet 5 yards and a half I pole, perch, or rod 1 furlong o poles or perches 8 furlangs LI English mile

#### And therefore,

mile furl. poles yards feet inches barly-corns
$$1-6-40-5\frac{1}{2}-3-12-3$$

$$1-8-320-1760-5280-63360-190080$$

$$1-40-220-660-7920-23760$$

$$1-5\frac{1}{2}-16\frac{1}{2}-198-594$$

$$1-3-36-108$$

$$1-12-36$$

And note, that the Yard, as also the Ell, is usually divided into 4 quarrers, and each quarter into 4 Nails.

Note also that a Geometrical Pace is 5 Feet; and here are 1056 fuch Paces in an English Mile.

9. The parts of the Superficial Measures of Land are fuch as are mention'd in the following Table, viz.

#### a Table of Land-Measure.

S SI Rood, or quarter an Acre. 40 fquare Poles or Perches 4 Roods

By the foregoing Table of Long Measure, you are in

form'd what a Pole for which is all one) a Perchin

and by this that 40 square Perches is a Rood. Now

a square Perch is a Superficies very aptly resembled by

a square Trencher, every fide thereof being a Perch

of 5 Yards and an half in length, 40 of them is a Rood

and A Roods an Acre. So that a Superficies that is 40

And

And here Note, That as the Hour is divided into 60 Minutes, so each Minute is subdivided into 60 Seonds, and each Second into 60 Thirds, and each Third nto 60 Fourths, & 60

The Tropical Year, by the exactest Observation of he most accurate Astronomers, is found to be 365 Days,

Hours, 49 Minutes, 4 Seconds, and 21 Thirds.

#### CHAP. III.

Of the Species and Kinds of Arithmetick.

A Rithmetick is either Natural, Artificial, Analyti-

2. Natural Arithmetick, is that which is performed by the Numbers themselves; and this is either Positive or Negative. Positive, which is wrought by certain infallible Numbers propounded, and this is either Single or Comparative: Single, which considereth the Nature of Numbers simply by themselves; and Comparative, which is wrought by Numbers that have Relation to one another. And the Negative part relates to the Rule of False.

3. Artificial (by some of the Logarithmetical) Arithmetick, is that which is perform'd by Artificial or borrowed Numbers invented for that purpose, and are

called Logarithms.

4. Analytical Arithmetick, is that which thews from a Thing unknown to find truly that which is fought, always keeping the Species without Change.

g. Algebraical Arithmetick, is an obscure, and hidden Art of Accompting by Numbers in resolving of hard Questions.

6. Lineal Arithmetick, is that which is perform'd by Lines fitted to Proportion, as Geometrical Projections.

7. Instrumental Arithmetick, is that which is perform'd by Instruments fitted with a Circular and Right Lines of Proportion, by the Motion of an Index, or otherwise.

8, The

8. The Parts of Single Arithmetick are Numeration

and the Extraction of Roots.

9. Numeration, is that by which certain known Numbers propounded, we discover another number unknown.

10. Numeration hath four Species, viz. Addition Subtraction, Multiplication, and Division.

#### CHAP. IV.

#### Addition of Whole Numbers.

A Ddition is the Reduction of two or more Numbers of like kind together into one Sum of Total. Or it is by which divers numbers are added together, to the end that the Sum or Total value of them all may be discovered.

The first Number in every Addition, is call'd Addible Number, the other, the Number or Numbers added, and the Number invented by the Addition is call'd the Aggregate or Sum containing the Value of the Addition.

The Collation of the numbers, is the right placing the Number given respectively to each Denomination, and the Operation, is the Artificial adding of the numbers given together in order to the finding out of the

Aggregate or Sum.

2. In Addition place the numbers given respectively the one above the other, in such fort, that the like degree, place or denomination, may stand in the same Series, viz. Units under Units, Tens under Tens, Hundreds under Hundreds, &c. Pounds under Pounds, Shillings under Shillings, Pence under Pence, &c. Yards under Yards, Feet under Feet, &c.

3. Having thus placed the numbers given (as before) and drawn a Line under them, add them together, beginning with the leffer Denomination, viz, at the Right Hand; and fo on subscribing the Sum under

the Line respectively; as for Example.

fore)

ther,

the

nder

Let

e Tens, &c. and draw a Line under them, in the Margent; then I begin at the place 3 f Units, and add them together upwards,

ying, 3 and 3 are 6, and 2 make 8, which 133 fet under the Line, and under the same igures added together; then I proceed in 3698 he next place, being the place of Tens, and

Id them in the same Manner as I did the place of Units saying, 3 and 1 are 4 and 5 are 9, which I kewise set under the Line respectively; then I go to he place of Hundreds, and add them up as I did the ther, saying, 1 and 2 are 3, and 3 are 6, which is so set under the Line; and lastly, I go to the place of Thousands, and because there are no other Figures to add to the 3, I set it under the Line in its respective slace, and so the Work is stailed; and I find the Sum

f the 3 given Numbers to be 3608.

4. But if the Sum of the Figures of any Series exeedeth Ten or any number of Tens, subscribe under
he same the excess above the Ten, and for every Ten
arry One to be added to the next Series towards the
Lest-Hand, and so go on till you have sinish'd your
Addition; always remembring, that how great sover
he Sum of the Figures of the last Series is, it must all
be set down under the Line respectively. So 3678 beng given to be added to 2357, I set them down as is
before directed, and as you see in the Margent, with
Line drawn under them, then I begin and

Line drawn under them, then I begin and dd them together, faying, 7 and 8 are 15, 3678 which is 5 above 10, wherefore I fet 5 under 235? the Line, and carry one for the 10 to be added —

to the next Series, faying, I that I carry'd and 6039
is 6; and 7 are 13, wherefore I fet down
and carry a (for the Ten) to the next Series; then

fay, I that I carry'd 3 are 4, and 6 are 10, now because it comes to just 10 and no more, I set o under the Line and carry I for the 10 to the next, and say, I Numbers

be added

Sum

con

re

121

to

and

28,

that I carry'd and 2 are 3, and 3 are 6; which I he down in its respective Place; thus the Adition is end ed, and the total Sum of these Numbers is found to be 6035. Several Examples of this Kind follow.

Numbers to be added	\$54867 \$573846 \$785946 \$47205	<b>%</b> -
Sum ,	2061864	91. M(20)
748647 465834 76483 648300	Numbers to be added	1 923
1939264	40017 Su	76

3. If the Numbers given to be added, are contain'd under divers Denominations, as of Pounds, Shillings Pence and Farthings ; or of Tuns, Hundreds, Quarters Pounds, &c. Then in this Case having disposed of the Numbers, each Denomination under other of the like Kind; beginning at the least Denomination, (mind ing how many of one Denomination do make an Integer in the next) and having added them up, for every Integer of the next greater Denomination that you find therein contain'd, bear an Unit in Mind to be added to the faid next greater Denomination, expressing the Excess respectively under the Line, proceed in this Manner until your Addition be finish'd; the following Example will make the Rule plain to the Learner. Thus these following Sums being gi ven to be added, viz. 136 l. 13 s. 4 d. 2 grs. and 79 l. 07 s. 10 d. 3 grs. and 33 l. 18 s. 09 d. 1 grs. alfo 15 1, 09 s. of d. o grs. The Numbers being disposed according to Order, will fland as in the Margent. Then I begin at the Denomination of Farthings,

and

d add them up faying, 1 and are 4, and 2 makes 6. Now I I onfider that 6 Fasthings are 1 146-enny and 2 Farthings, where-re I fet down the 2 Farthings 33-its place under the Line; and ep 1 in mind to be added to e next denomination of Peace: ten I go on faying, 1 that I cared and 5 are 6; and 9 are 15 and to are ep; now I confider that 29 Pence are 2

1. s, d. 975. 146-13-04-2 79-07-10-3 33-18-09-1 15-09-05-0

ed and s are 6; and 9 are 15 and to are as, and 4 are : now I confider that 29 Pence are 2 Shillings and Pence, therefore I fet down ; Pence in order under he Line, and keep 2 in mind for the 2 Shillings, to be ided to the Shillings; then I go on faying, 2 that I arry'd and 9 are 11, and 18 are 29, and 7 are 16. nd 13 are 49; then I confider that 49 Shillings are Pounds and o Shillings, wherefore I fet the oShillings nder the Line, and carry the 2 for the a Pounds to he next and last Denomination of Pounds, and proeed, faying, 2 that I carri'd and 5 make 7, and 3 are o, and 9 are 19, and 6 are 25, then I fet down 5. and arry 2 for the 2 Tens; and proceed, faying, 2 that I arry and 1 is 3, and 3 are 6, and 7 are 13, and 3 nake 16, and I fet down 6 and carry 1 for the 10, and o on, faying, I that I carry'd and I are 2, which I fet nints place under the Line, and the Work is finish'd od thus I find the Sum of the foresaid Numbers to pe 165 1.9 s. 5 d. 2 ogrs. This to the ingenious Practiioner is sufficient; but I shall (for the further Illumipating of the weaker Apprehensions) explain the Operation of another Example in Troy-weight; and here the Learner must take notice of the Table of Trop-weight, mention'd or fet down in the third Section of the Second Chapter. The Numbers given in this Example are 38 1. 7 oz. 13 p.w. 18 gr. and 50 l. 10 oz. 10 p.w. 12 gr. and 42 l. c8 ez. 05 p.w. 16 gr. and in order to the Addition thereof I place them as you fee, and proceed to Operation; faying, 16 and 12 are 28, and 18 are 46; now because 24 Grains make 1 Penny

#### . The Proof of Addition.

6. Addition is prov'd after this Manner: When you rive found out the Sum of the Number given, then eparate the uppermost Line from the rest with a stroke or dash of the Pen, and then add them all up again as you did before, leaving out the uppermost Line; and having fo done, add the new invented Sum to the uppermost Lines you separated, and if the Sum of those wo Lines be equal to the Sum first found out, then the Work was performed true, otherwise not. As for Example ; Let us prove the first Example of Addition of Meney, whose Sum we find to be 265 1. 9 s. 5 d. 2 grs. and which we prove thus; Having separated the uppermost Number s. d. grs. from the rest by a Line, as you see 136-13-04-2 in the Margent, then I add the same together again, leaving out 79-07-10-2 the faid uppermost Line, and the 34-18-09-E Sum thereof I set under the first 15-09-05-0 Sum or true Sum, which doth amount to 128 1. 16 s. 1 d. 0 grs. 269-09-09-2 then again, I add this new Sum to the uppermost Line that before 128-16-01-0 was separated from the rest, and the Sum of those two is 265 1. 09 1. 265-09-05-2 of d. 2 grs. the same with the first Sum, and therefore I conclude that the Operation was rightly perform'd.

7. The main End of Addition in Questions resolvable thereby, is to know the Sum of several Debts, Parcels, Integers, &c. Some Questions may be these

that follow.

Quest. 8. There was an old Man whose Age was requir'd; to which he reply'd, I have Seven Sons, each having two Years between the Birth of each other, and in the 44th Year of my Age my eldest Son was born, which is now the Age of the youngest. I demand, What was the old Man's Age?

C 2

Set the Sums lent one under another, as you fee in the Margent, and then add them together, and you will find their Sum to amount to 317 l which is the Total of all the several Sums lent, and so much is due to the Creditor.

Quest. 2. From London to Ware is 20 Miles, thence to Huntington 29 Miles, thence to Stamford 21 Miles, thence to Wentbridge 13 Miles, from thence to York 20 Miles. Now I defire to know how many Miles it is from London to York, according to this Reckoning?

Now to answer this Question; set down the several Distances given, as you see in the Margent, and add them together, and you will find their Sum to amount to 151, which is the true Distance in Miles between London and York.

151 Queft. 4. There are two Numbers, the least whereof is 40, and their Difference 14. I 40 defire to know what is the greater 14 Number, and also what is the Sum of them both? First set down the greatek 54 least, (viz) 40, and 14, the Diffeleaft 40 rence, and add them together, and their Suni is 54 for the greatest Sum

Mumber, then I fet 40 (the least) un-

#### CHAP. V.

### Of Reduction of Whole Numbers.

NUBTR ACTION, is the taking of a leffer Number out of a greater of a like Kind, whereby to nd out a third Number, being or declaring the Inepality, Excess or Difference between the Numbers ven; or Subtraction is that by which one Number is ken out of another Number given, to the End that e Residue or Remainder may be known, which Reainder is also call'd the Rest, Remainder, or Diffence of the Number given.

2. The Number out of which Subtraction is to beade, must be greater or at least equal with the other umber given; the higher or superiour Number is Il'd the Major Mumber, and the lower or inferior is Il'd the Minor Number; and the Operation of Sub-Him being finish'd, the Reft or Remainder is call d

e Difference of the Numbers given.

3. In Subtraction place the Numbers given respeively, the one under the other, in fuch Sort as like grees, Places or Denominations may stand in the ne Series, viz Units under Units, Tens under Tens. bunds under Pounds, &c. Feet under Feet, and Parc der Parts, Ge. This being done, draw a Line unrneath, as in Addition.

7. Having placed the Numbers given as is before difled, and drawn a Line under them, subtrect the wer Number (which in this Case must always be sels in the uppermost) out of the higher Numbers and oscribe the Difference or Remainder respectively low the Line; and when the Work is finish'd, the

Number below the Line will give you the Remain.

As for Example, Let 364521 be given to be subtrace ted from 795836, I for the leffer under the greater, if in the Margent, and draw a Line under them, then beginning at the Right Hand, I fay, I out of 6, and there remains 5, which I fer in 795816 order under the Line; then I proceed to the 364511 nexe, faying, 2 from 3 rests 1, which I note allo under the Line; and Lius I go on till I 431319 have finished the Work; and then I find the

Remainder or Difference to be 431315.

But if it so happen (as commonly it doth) that the lowermost Number or Figure is greater than the uppermost; then in this Case add ten to the upper most Number, and subtract the said lowermost Number from their Sum, and the Remainder place under the Line, and when you go to the next Figure below pay an Unit by adding it thereto for the ten you ber rowed before, and subtract that from the higher Num ber of Figures, and thus go on till your Subtraction be finished. As for Example; Let 437503 be given from whence it is required to subtract 153827, I dil pose of the Numbers as is before directed, and as you fee in the Margent; then I begin, faying, 7 from ; cannot, but (adding to thereto) I fay, 7 from 13 an there remains 6, which I fet under the Dine in order; then I proceed to the 43750 next Figure, faying 1 that I borrowed 15381 and 2 is 3 from o I cannot, but 3 from and 2 is 3 Holli of the which I like- 18367 bm 5 wife fet down as before; then I that I borrowed and & is nine, from 5 I cannot, but 9 from 15 and there remains 6; then 1 borrows from and 3 is 4 from 7 and there remains 3; then 5 from rains 3 I cannot, but 5 from 13, and there remains 8; the (13) I borrowed and 1 are 2 from 4, and there rests 1 ains and thus the Work is finished; And after these Num 9, 1 bers are subtracted one from another, the Inequalit t 8; Remainder, Excess or Difference is found. Remainder, Excess or Difference, is found to 28367

676. Example for thy farther Experience may be that follow.

rom 3469916 738642 Take

From 361576 Take

Refts 355712 lefts 273.1274 . If the Sum or Number to be subtracted is of eral Denominations, place the leffer Sum below the ater, and in the same Rank and Order, as is shewed Addition of the fame Numbers; then begin at the he Hand and take the lower Number out of the upmost, if it be leffer; but if it be bigger than the upmost, then borrow an Unit from the next greater nomination, and turn it into the parts of the lefs nomination, and add those parts to the uppermost. ing the Remainder below the Line; then proceed pay 1 to the next Denomination for that which borrowed before, and proceed in the Order until Work be finish'd. An Example of this Rule may this that followeth; Let 375 l. 13 s. 7 d, 1 gr. be en, from whence let it be required to subtract 57 1. 1. 03 d 2 grs. In order whereunto, I place the imbers as you fee in the Marit; and thus I begin at the least 1. s. d gry.

nomination, faying, two from 375 -13-07-1 e I cannot, therefore I borrow 57-16-03-2 e Penny from the next Deno- ---artion, and turn it into Far- 317-17-03-3

to 1 which is 5, I say, but 2

8367 om 5, and there remains 3, which I put under the ne; then going on, I say, 1 that I borrowed and 3 and there rests 3; then going on, I say, 2 then going on, I say from 7, and there relts 3; then going on, and from 13 I cannot, but borrowing 1 Found, and from 13 I cannot, but borrowing 1 Found, and that raining it into 20 Shilings, I add it to 13, and that 1 the (13) wherefore I fay, 16 from 33, and there results 1 mins 17, which I fet under the Line, and go on, fayNum g, 1 that I borrowed and 7 is 8 from 3 I cannot, t & from 15, and there remains 7; the one that I

to prove the Work, whether it be true or no; the add the Remainder to the minor Number, and if the Aggregate of these two be equal to the major Number then is your Operation true, otherwise false: Thusle us prove the first Example of the fifth Rule of the Chapter, where after Subtraction is ended, the Num bers stand as in the Margent, the Remainder or Di ference being 283676. Now to prove the Work add the faid Remainder 283676 to the minor Number 153827; by the fourth Rule of 43750 the foregoing Chapter, and I find the Sum 153817 or Aggregate to be 437503, equal to the mafor Number, or Number from whence the 283676 leffer is subtracted. Behold the Work in the Margent. 43.750

The Proof of another Example, may be of the find Example of the fixth Rule of this Chapter, where it requir'd to subtract 57 l. 16 s. 3 d. 2 grs. from 3751 13 s. 7 d. 1 gr. and by the Rule I find the Remainder to be 317 l. 17 s. 03 d. 3 gr. Now so prove it, I add the said Remainder 317 l. 17 s. 03 d. 3 grs. to the minor Number 57.1. 16 1. 03 d. 2 grs. and their Sum is 375 l. 13 s. 07 d. 1 gr. equal to the major Number, which proves the Work to be true; but if it had happen'd to have been either more or less than the said mafor Number, then the Operation had been false.

375-13-07-1 57-16-03-317-17-03-1 375-13-07-1

6. The general Effect of Subtraction, is, to find the Difference or Excess between two Numbers, and the Rest when a Payment is made in part of a greater Sum, the Date of Books printed, the Age of any Thing by knowing the present Year, and the Year wherein they are made, created or built, and fuch-like.

The Questions appropriated to this Rule are such

Quest. 1, What Difference is there between one Thing of 125 Foot long, and another of 66 Foot long?

To resolve this Question, I first set down the major or greater Number 125, and under it the minor or lesser Number 66, as is directed in the third Rule of this Chapter, and according to the sourth Rule of the same, I subtract the minor from the major, and the Remainder, Excess or Difference, I find to be 59. See the Work in the Margent.

Queft. 2. A Gentleman oweth a Merchant 3651, whereof he hath paid 278 1. what more doth he owe?

To give an Answer to this Question, I first set down the major Number 365 l. and under 365 it I place 278 the minor, and subtract the one 278 from the other, whereby I discover the Excess, Difference or Remainder, to be 87, and 87 so much is still due to the Greditor; as per-Margent.

Quef. 5. An Obligation was written, a Book printed, a Child born, a Church built, or any other Thing made in the Year of our Lord 1572, 1687 and now we account the Year of our Lord 1572 1687, the Question is to know the Age of the the said Things; that is, How many Years are 115 pass'd since the said Things were made? I say, if you subtract the lesser Number 1572, from the greater 1687, the Remainder will be 115, and so many Years are pass'd since the making of the said Things; as by the Work in the Margent.

Quest. 4. There are Three Towns lie in a straight Line, viz. London, Hunsington and York, now the Distance between the farthest of these Towns, viz. London and York, is 151 Miles, and from London to Hundington is 49 Miles, I demand, How far it is from Huntington to York?

Quel

The

Chap. 6

bec

wh

up

Carr

101

To resolve this Question, subtract 49 the Distance between London and Huntington, from 151 the Distance between London and York, and the Remainder is 102 for the true Distance between Huntington and York. See the Work in the Margin.

#### CHAP. VI.

Of Multiplication of Whole Numbers.

Numbers of like Kind for the production of a third, which shall have such Reason to the one, as the other hath to the Unit, and in Effect is a most brief and artificial Compound Addition of many equal Numbers of like Kind into one Sum. Or, Multiplication is that by which we multiply two or more Numbers, the one into the other, to the End that their Product may come forth, or be discover'd.

Or, Multiplication is the increasing of any one Number by another, so often as there are Units in that Number, by which the other is increased, or by having two Numbers given to find a third, which fail contain one of the Numbers as many times as there

are Units in the other.

2. Multiplication hath three Parts. First, The Multiplicand or Number to be multiply'd. Secondly, The Multiplier or Number given by which the Multiplicand is to be multiply'd. And thirdly, The product or Number produced by the other two, the one being multiply'd by the other, as if 8 were 8 given to be multiply'd by 4, I say 4 times 8 is 4 32; here 8 is the Multiplicand, and 4 is the Multiplier, and 32 is the product.

3. Multiplication is either Single, by one Figure; or Compound, that confifts of many.

Single

Single Multiplication is faid to confift of one Figure. because the Multiplicand and Multiplier consist each of them of a Digit, and no more; so that the greatest product that can arise by Single Multiplication, is \$1, being the fquare of 9; and Compound Multiplication, is faid to confift of many Figures, because the Multiplicand or Multiplier confists of more places than one; as if I were to multiply 436 by 6: It is call'd Compound, because the Multiplicand 436 is of more places than one, viz. 3 places.

4. The Learner ought to have all the Varieties of Single Multiplication by Heart, before he can well proceed any farther in this Art, it being of most excellet Use, and none of the following Rules in Arithmetick, but what have a principal Dependance thereupon, which may be learnt by the following Table.

### Multiplication TABLE.

	100		Age	Mark	14-14	"Track	1	3 3 3 3
1	2	3	4	75	16	37	8	2
2	4	6	- 8	10	12	14	16	18
3	6	9	12	15	18	21	24	27
						28		
5	10	15	20	25	30	35"	40	45
6	12	18	24	30	36	42	48	64
7	14	21	2,8	35	42	49	56-	63
8	16	24	32	40	48	56	64	72
9	18	27	36	1 45	54	63	172	81

The Use of the precedent Table is this; In the uppermost Line or Column you have express'd all the Digits from 1 to 9; and likewife beginning at 1 and going downwards in the fide Column, you have the same; so that if you would know the Product of

and two fingle Numbers multiply'd by one another look for one of them (which you please) in the upper most Column, and for the other in the fide Column and running your Eye from each Figure along the spective Columns, in the common Angle (or place where these two Columns meet, there is the Produ required. As for Example, I would know how much is 8 times 7; First I look for 8 in the uppermost Co lumn, and 7 in the fide Column; then do I caff m Eve from 8 along the Column downwards from the fame, and likewife from y in the fide Column, I cal my Eye from thence toward the Right Hand, and find it to meet with the first Column at 56, so that I con clude 56 to be the Product requir'd; it would have been the same if you had looked for 7 in the top, and 3 on the fide; the like is to be understood of any o ther fuch Numbers. The Learner being perfect here in, it will be necessary to proceed.

40

5. In Compound Multiplication, if the Multiplicand con fifts of many places, and the Multiplier of but on Figure; first set down the Multiplicand, and under place the Multiplier in the place of Units, and draw Line underneath them; then begin and multiply the Multiplier into every particular Figure of the Multi plicand, beginning at the place of Units, and fo pro ceed towards the Left Hand, fetting each particular Product under the Line, in order as you proceed : But if any of the Products exceed to, or any Number of Tens let down the Excels, and for every 10 carry Unit to be added to the next Product, always remembring to fet down the total Product of the last Figure: which Work being finish'd, the Sum or Number placed under the Line shall be the true and total Product requir'd. As for Example, I would multiply

478 by 6: First I set down 478, and undermenth it 6, in the place of Units, and draw a Line underneath them, as in the Margent; then I begin, saying, 6 times 8 is 48, which is 8 above four Tens, therefore I set down 8 (the Excess) and bear 4 in Mind for the

ens:

4 Tens; then I proceed, faying, 6 times 7 is 42, and 4 that I carry'd is 46, I then fit down 6, and carry 4, and go on, faying, 6 times 4, is 24, and 4 that I carried is 28, and because it is the last Figure, I set it all down, and so the Work is finished, and the Product

is found to be 2868, as was required.

6. When in Compound Multiplication, the Multiplier confisteth of divers places, then begin with the Figure in the place of Units in the Multiplier, and multiply it into all the Figures in the Multiplicand placing the Product below the Line, as was directed in the last Example; then begin with the Figure of the fecond place of the Multiplier, (viz) the place of Tens, and multiply it likewise into the whole Multiplicand (as you did the first Figure) placing its Product under the Product of the first Figure; do in the fame Manner by the Third, Fourth, and Fifth, &c. until you have multiply'd all the Figures of the Multiplier particularly into the whole Multiplicand, still placing the Product of each particular Figure under the Product of its precedent Figure ; herein observing the fellowing Caution.

In the placing of the Product of each particular Figure of the Multiplier, you A Caution.

are not to follow the 2d Rule of the 4th

Chapter, viz. to place Units under Units, and Tens under Tens, &c. but to put the Figure or Cypher in the place of Units of the second Line under the second Figure or place of Tens in the Line above it, and the Figure or Cypher in the place of Units in the third Line under the place of Tens in the second Line, &c. observing this Order till you have finished the Work, still placing the first Figure of every Line or Product under the second Figure or place of Tens in that which was above it, and having so done, draw a Line under all these particular Products, and add them together; so shall the Sum of all these Products be the total Product required.

As if it were required to multiply 764 by 27, I fet them down the one under the other, with a Line drawn

under

underneath them; then I begin, saying, 7
times 4 is 28, then I set down 8 and carry 2; 764
then I say, 7 times 6 is 42, and 2 that I carried is 44, that is 4 and go 4; then 7 times 7
is 49, and 4 that I carry is 53, which I set
down, because I have not another Figure to
multiply; thus I have done with the 7, then
I begin, with the 2, saying, 2 times 4 is 8, 20628

which I set down under (4) the second Figure or place of Tens in the Line above it, as you may see in the Margent; then I proceed, saying, a times 6 is 12, that is 2 and carry 1, then 2 times 7 is 14, and 1 that I carry, is 15, which I set down because tis the product of the last Figure; so that the product of 764 by 7 is 5348, and by 2 is 1528, which being placed the one under the other, as is before directed, as you see in the Margent, and a Line drawn under them, and they added together respectively, make 20628, the true product required, being equal to 27 times 764.

Another Example may be this; Let it be required to multiply 5486 by 465, I dispose of the Mulitiplicand and Multiplier, according to 5486 the Rule, and begin multiplying the first 365 Figure of the Multipliet, which is (5) into the whole Multiplicand, and find the Pro-27450 duct is, 27430; then I proceed, and multi-32916 ply the second Figure (6) of the Multiplier 21944 into the Multiplicand, and find the product to amount to 32916, which is fubicribed 2553990 under the other product respectively ; then do I multiply the third and last Figure (4)

of the Multiplier into the Multiplicand, and the Product is 21944, which is likewise placed under the second Line respectively; then I draw a Line under the said Products (being placed the one under the other according to Rule) and add them together, and the Sum is 2550690, the true Product sought, being equal

60 5486 times 465, or 465 times 5486.

7. Although the former Rules are sufficient for all

ases in Multiplication, yet ecause in the Work of Multilication many times great Laour may be saved, I shall acuaint the Learner with some
compenditions in order thereo, viz. If the Multiplicand
or Multiplier, or both of them
and with Cyphers, then in
our multiplying you may no
nultiply only the fignificant

Sic numeris propositis unus vel uterque adjunctos habeat ad deuram circules, emissis circulis sas spsemm numere, rum modeiplicatio, & fatto demum tot insuper integrerum loci accenseantur quos sunt omissi circuli in utroque sattora, Claus Mat. c. 4.31

your multiplying you may neglect the Cyphers, and nultiply only the fignificant Figures, and to the proluct of those significant Figures, add so many Cyphers is the Numbers given to be multiply'd did end with;

that is, annex 'em on the Right Hand of the said product, so shall that give you the true product required. As if I were to multiply 32000 by 4303, I set them down in order to be multiply'd, as you see in the Margent, but neglecting the Cyphers in both Numbers, I only multiply 32 by 43, and the product

I find to be 1376, to which I annex the 5 Cyphers that are in the Multiplicand and Multiplier, and then it makes 137600000 for the true Product of 32000 by 4300.

8. If in the Multiplier, Cyphers are plac'd between fignificant Figures, then multiplicant si intermedio multiplitical tiply only by the fignificant cantis loco circulus fuerit, Figures neglecting the Cyphers are plac'd between fignificant si intermedio multiplication.

ille negligitur. Alsted. c. 6. De Arithm. fignificant Figures, then multiply only by the fignificant Figures, then multiply only by the fignificant Figures neglecting the Cyphers; but here special Notice is to be taken of the true placing of the first Figure after

cing of the first Figure after the Neglect of fuch Cypher or Cyphers; and therefore you must observe in what place of the Multiplier the Figure you Multiply by standeth, and fet the first Fi gure of that Product under the fame place of the Pro duct of the first Figure of your Multiplier: As for Ex ample, Let it be requir'd to multiply 371568 by 40007. First I multiply the 3.7.156 Multiplicand by 7, and the Product is 40001 2600976, then negleding the Cyphers I 2600976 multiply by 4, and that Product is 1486272; now I confider, that 4 is the 5th 1486272 Figure in the Multiplier, therefore I place

under the 5th place of the 1st Product by 7, and the rest in order; and having added them to gether, the total Product is found to be 14865320976. Other Examples in this Rule, are these following:

2 (the ift Figure of the Product by 4)

327586 6030 9827580 20604 31457484 47186226 15728742 1975343580 162037500084

9. If you are to multiply any Number by an Unit with Cyphers (viz.) by 10, 100, 1000, &c. then annex so many Cyphers before the Multiplicand, and that Number when the Cyphers are annex'd is the Product required, if you would multiply 428 by 100, annex two Cyphers to 428, and it is 42800. If it were required

quired to multiply 102 by 10000, annex 4 Cyphers, dit gives 1020000 for the Product required.

The Proof of Multiplication.

10. Multiplication is proved by Division, and to speak uth, all other Ways are false; and therefore it will be off convenient in the first

ace to learn Division, and

There is a Way (at is Day generally used in

hools) to prove Multipli-

Nama; est quod aliam expethat to prove Multiplica- Ges examinandi viam ; nam alia vulgares & falsa sunt, o nulle innixæ fundamente. Gemma Frifius.

ion, which is this; First, dall the Figures in the Multiplicand together, as if ey were Simple Numbres, casting away the nines as

as it comes to fo much, noting the Remainder at which in this Cafe cannot be fo much as 9: Caft ewife the Nines out of the Multiplier as you did out the Multiplicand, and note the Remainder; then altiply the Remainders, one by the other, and cast the pes out of the Product, observing the Remainder: nd laftly, cast the Nines out of the total Product, and this Remainder be equal to the Remainder last found. in they conclude the Work to be rightly perform'd : t there may be given a thousand (nay infinite) false educts in Multiplication, which after this Manner may prov'd to be true; and therefore this Way of Provdoth not deserve any Example; but we shall defer

then we shall prove them both together. I. The general Effect of Multiplication, is contain'd the Definition of the same, which is to find out a rd Number, so often containing one of the two

Proof of this Rule till we come to prove Division,

en Numbers, as the other containeth Units.

The second Effect is, by having the length and adth of any Thing (as a Parallelogram or long Plain) the superficial Contents of the same, and by ing the superficial Content of the Base, and the ngth, to find out the Solidity of any Parallelopipe-, Cylinder, or other folid Figures.

The

The third Effect is, by the Contents, Price, Val Buying, Selling, Expence, Wages, Exchange, Sim Interest, Gain or Loss of any one Thing, be it Mon Merchandize, &c. to find out the Value, Price, I pence, Buying, Selling, Exchange or Interest of a number of Things of like Name, Nature and Kind

The fourth Effect (is not much unlike the other) the Contents, Value, or Price of any one part of a Thing denominated, to find out the Contents, Value or Price of the whole Thing, all the parts into who the whole is divided, multiplying the Price of one those Parts.

The fifth Effect is, to aid, to compound, and make other Rules, as chiefly, the Rule of Proporticall'd the Golden Rule, or Rule of Three; also by it, This of one Denomination are reduc'd to another.

If you multiply any number of Integers, or the? of the Integer, the Product will discover the Price the Quantity, or number of Integers given.

In a Rectangular Solid, if you multiply the brea of the Base by the depth, and that produce by length, this last Product will discover the Solidity Content of the same Solid.

Some Questions proper to this Rule, may be these follow

Ground, whose length is 28 Perches, and breadth Perches?

Infwer, 364 square Perches; for multiplying, 281 length by 13 the breadth, the product is so much

Quest. 2. There is a square Battle whose Flank is Men, and the Files 19 deep, what number of Men of that Battle contain? Facis, 893; for multiplying by 19, the product is 893.

Queft. 3. If any one Thing cost 4 Shillings, with thall 9 Things cost? Answ. 36 Shillings; for m

plying 4 by 9, the product is 36.

of Money or Merchandize coft ! Facit, 323 Shillings,

which is equal to 161.3 r.

Queft. 5. If a Soldier or Servant get or spend 14 s. per Month, what is the Wages or Charges of 49 Soldiers or Servants for the same Time? Multiply 49 by 14, the Product is 686 s. or 34 l. 6 s. for the Answer,

Quest. 6. If in a Day there are 24 Hours, how many Hours are there in a Year, accounting 365 Days to constitute the Year Facis? 8760 Hours; to which if you add the 6 Hours over and above 365 Days, as there is in a Year, then it will be 8766 Hours; now if you multiply this 8766 by 60, the number of Minutes in an Hour, it will produce 525960 the number of Minutes in a Year.

#### CHAP. V.

# Of Division of Whole Numbers

affign'd, or to find how often one Number is contain'd n another; or from any two Numbers given, to find a third that shall consist of so many Units, as the one of those two given Numbers is comprehended or con-

tained in the other.

2. Division hath three Parts or Numbers remarkable, wix. First the Dividend. Secondly, the Divisor. Thirdly, the Quotient. The Dividend is the Number given, to be parted or divided. The Divisor is the Number given by which the Dividend is divided, or it is the Number which sheweth how many Parts the Dividend is to be divided into. And the Quotient is the Number produc'd by the Division of the two given Numbers, the one by the other.

So 12 being given to be divided by 3, or into three equal Parts, the Quotient will be 4, for 3 is contain'd in 12 four times, where 12 is the Dividend, and 3 is

the Divisor, and 4 is the Quotient,

3. In Division set down your Dividend, and draws crooked Line at each End of it, and before the Line at the Left Hand place the Divisor, and behind that on the Right Hand place the Figures of the Quotient, as in the Margent, where it is 3) 12 (4 required to divide 12 by 3: First, I set

down 12 the Dividend and on each Side of it, del draw a crooked Line, and before that on the Left Hand do I place 3 the Divisor; then do I seek how often; is contain'd in 12; and because I find it 4 times, I put 4 behind the crooked Line, on the Right Hand of the

Dividend, denoting the Quotient.

4. But if when the Divisor is a single Figure, the Dividend confideth of two or more places, then he ving placed them for the Work (as is before directed out a Point under the first Figure on the Left Hand of the Dividend, provided it be bigger than (or equi to) the Divisor, but if it be lesser than the Divisor then put a Point under the second Figure from the Left Hand of the Dividend; which Figures as far as the Point goeth from the Left Hand, are to be reckon'd by themselves, as if they had no Dependance upon the other part of the Dividend : and for Distinction sale may be called the Dividual; then ask how often the Divisor is contain'd in the Dividual; placing the Anfwer in the Quotient; then multiply the Divisor by the Figure that you placed in the Quotient, and fet the Product thereof under your Dividual; then draw ! Line under the Product, and Subtract the faid Product from the Dividual, placing the Remainder under the faid Line; then put a Point under the next Figure in the Dividend on the Right Hand of that to which you put the Point before, and draw it down, placing it on the Right Hand of the Remainder which you found by Subtraction; which Remainder, with the faid Figure annexed before it, shall be a new Dividual; then feet again how often the Divisor is contain'd in this new Dividual, and put the Answer in the Quotient on the Right Hand of the Figure which you put there before then multiply the Divisor by the last Figure that you put

Whole Numbers hap. 7. t in the Quotient, and Subscribe the Product und Dividual, and make Subtraction, and to the B inder draw down the next Figure from the gran vidend, (having ark put a Point under it) and put on the Right-hand of the Remainder for a new Di lual as before, &c. and proceed thus sill the World finished, Observing this general Rule in all Kinds of Division? First. To seek how often the Divisor is contained in Dividual; then having put the Answer in the quos nt) multiply the Divisor thereby, and subtract the dust from the Dividual. An Example or two will ke the Rule plain. Let it be required to divide 84 by 6. I dispose of the Numbers given as is bee directed, and as you fee in the Marnt,in order to the Work, then (because he Divisor is more than 2 the first Fire of the Dividend, I put a Point unthe second Figure, which makes the 21 for the vidual, then do I ask how often 6 the vifor is contain'd in 21, and because I not have it more than three times, I t 3 in the Quotient, and thereby do I 18 ltiply the Divisor (6) and the Product. 8, which I fet in order under the Didal, and subtract it therefrom, and Remainder (3) I place in order under the Line, it fee in the Margent. Then do I make a Point under the at Figure of the Dividend, being 8. draw it down, placing it before the mainder 3, so have I 38 for a new 18 vidual, then do I feek how often 6 is htain'd in 38, and because I cannot have 38 nore than 6 times, I put 6 in the quo-36 nt, and thereby do I multiply the Di. or 6, and the Product (36) I put unthe Dividual (38) and subtract it refrom, and the Remainder 2 I put under the ne, as you fee in the Margent. Then

5. But if the Divisor consistent of more places than one, then choose so many Figures from the Lest-side of the Dividend for a Dividual as there are Figures in the Divisor, and put a Point under the farthest Figure of that Dividual to the Right-hand, and seek how often the first Figure on the Lest-side of the Divisor is contained in the first Figure on the Lest side of the Dividual, and place the Answer in the Quotient, and there by multiply your Divisor, placing your Product under your Dividual, and subtract it there from, placing the Remainder below the Line; then put a Point under the next Figure in the Dividend, and draw it down to the said Remainder, and annex it on the Right-side shereof, which makes a new Dividual, and proceed a before, till the Work is sinished.

And if it so happen that after you have chosen your first Dividual, (as is before directed) you find it to be desired than the Divisor, then put a Point under the Figure more near to the Right-hand, and seek how often the first Figure on the Lest-side of the Divisor is contained in the two first Figures on the Lest-side of the Dividual, and place the Answer in the Quoment, by which multiply the Divisor, and place the Production thereof in order under the Dividual, and subtract in

cherefrom, and proceed as before.

Always remembring, (that in all Cases of Division) if after you have multiply'd your Divisor by the Figure first placed in the quotient, if the Product be greater than the Dividual, then you must cancel that Figure in the quotient, and instead thereof put a Figure lesser by an Unit (or one) and multiply the Divisor thereby, and if still the Product be greater than the Dividual, make the Figure in the quotient yet lesser than the Dividual, and thus do until your Product be lesser than the Dividual, or at the most equal thereto, and then make Subtraction, &c.

So if you would divide 9464 by 24, the Quotient will be found to be 394; I first put down the given Number as is before directed in the third Rule. Now

1540

(163)

Dividual) and I fay, there is 9 times 3 in 28, but multiplying my whole Divisor (385) thereby; I find the Product to be 3465; which is greater than the Dividual 2865, wherefore I chuse 8, which is lesser by an Unit than 9, and thereby I multiply my Divisor 385, and the Product is 3080, which still is greater than the faid Dividual, wherefore I chose another Number yet an Unit leffer, viz. 7, and having multiply'd my Divifor thereby, the Product is 2695, which is leffer than the Dividual 2865, wherefore I put 7 in the Quotient and subtract 2695 from the Dividual 2865, and there remains 170; then I draw down the last Figure (3) in the Dividend, and place it before the faid Remainder 170, and it makes 1707 for

a new Dividual; then (for the 385) 1183653 (3073 Reason abovesaid) I seek how. often 3 is contain'd in 17, the

Answer is 5, but multiplying the Divisor thereby, the Produst is 1925, greater than the Dividual, wherefore I fay it will

bear 4 (an Unit leffer) and by it I multiply the Divisor 385. and the Produtt is 1540, which

is leffer than the Dividual, and therefore I put 4 in the Quo-

tient, and subtract the faid Product from the Dividual, and there remaineth 162; and thus the Work is finithed; and I find that 1183653 being divided by 385 (Remember 1 156)

Chap. Division of 56 or into 385 equal Shares or Parts, (the Quotient one of those Parts,) is 3074, and besides there is 161 remaining. And thus the Learner being well-vers'd in the Me shod of the foregoing Examples, he may be fufficient ly qualified for the dividing of any greater Sum of Number into as many Parts as he pleaseth, that is, he may understand the Method of dividing by a Divisor which confisteth of 4, or 5, or 6, or any greater Num ber of places, the Method being the fame with the for going Example in every respect. Other Examples in Division. 27986) 835684790 (29860 55972 279964 251874 140907 223888 170199 167916 Remains (22830) \$96374) 473986018 (2412 292748 812380 785496 268841 3966374 724678 589122 Kemein (135556)

for, um. 94

So if you divide 47386473 by \$8736, you will find the Quotient to be 806, and 45257 will remain after the Work is ended.

In ike manner if you would divide 3846739204 by \$1064, the Qurient will be 7963, and the Remain-

der after Divition will be 100572.

Compendium in Division.

I. If any given Number be to be divided by another Number that back Curbers Side chereof, (omitting the Cyphers) you may cut off

to many figures from the Right Hand of the Dividend, as there re Cyphers before the Divisor, and let the remaining Numbers. in the Dividend, be divided by the remaining number or numbers of the Divisor, observing this Caution, that if after your Division is ended any thing remain, you are to annex thereto

Et fi Divisor adjunctos fibi habeat Circulos ad dextram omiffis circulis & obfciffis torldem ultimis Figuris 1 div.de di, in numeris relique at divisio, in 6 de autem divisionis reftimendi funt tum omiffi circuli tum fgura absciffa. Ough, Cla. Massb. cap. 5.3.

he Number or Numbers that were cut off from the Diridend; and fuch new found Number shall be the Re-

nainder. As for Example ; Let t be required to d vide 46658 by 400, now because there are Cyphers before the Divisor, cur off as many Figures from efore the Dividend viz. 58 for hat then there will remain ony 466 to be divided by 4, and he Quorient will be 116, and hase will remain 2, to which I nex the two Figures (18) which were cut off from the Dididend, and it makes 258 for

400) 466 58 (116

(258)

be true Remainder; fo that I conc'ude 45658 being ? ivided by 400, the Quotient will be 116 and 258 remain after the Work is ended; as by the Work in Margent.

Agara productum of endant. Ablatum Residuum, Oc. Sem. Frif. Arith. Part. I.

2. And hence it followeth, that if the Divifor be (1) or a Unit with Cyphers an nexed, you may cut off 6 many Figures from before the Dividend, as there are C. phers in the Divisor, and the the Figure or Figures that an on the Left Hand will be the Quotient, and those that are

on the Right Hand will be the Remainder after the Division is ended: Asthus; If 45782 were to be di wided by 10, I cut off the last Figure (1) with a Dat shus, (4578 3) and the Work is done, and the Qua tient is 4578 (the Number on the Left Hand of the Dafh) and the Remainder is 3 (on the Right Hand). Is like manner if the fame Number 45783 were to bed wided by 100, I cut off two Figures from the end thu (457 |83) and the Quotient is 45%, and the Remainder And if I were to divide the fame by too, I co off a Figures from tho end thus (45/704) and the Qua mient is 45, and 783 the Remainder, Oc.

6. The general Effect of Division, is contained in the Definition of the same (that is) by having two une qual Numbers given, to find a third Number in fud Proportion to the Dividend, as the Divsfor hath the Unit or 1. It also discovers what Reason or Propos tion shere is between Numbers; for you divide n by a, ir quotes 3, which thews the Reason or Propos

tion of 4 to 12 is triple.

The fecond Effect is, by the superficial Measured Content, and the length of any Oolong, Rectangula Barallelogram, or fq are Plane, known, to find out the Breadth thereby; or contrary wife, by having the fuper ficies and breadth of the faid Figure, to had out Jengri cheleof. Alfo by having the folidity and length of a Solid, to find the Superficies of the Bale, of out

PRICE

angr

LOB

Contents, Resson, Price, Value, Buying, Selling Expence, Wages, Exchange, Intereft, Profit or Lols, or

any one Thing of like Kind.

The fourth Effect is, to Aid, to Compole, and to Make other Rules, but principally the Rule of Proport tion, call'd the Goiden Rule, or Rule of Three, and the Reduction of Monies, Weights and Measures of one Denomination into another; by it also Fractions are abbreviated by finding a Common-Measurer; unto the Numerator and Denominator, thereby difcovering Commensurable Numbers.

If you divide the Value of any certain Quantity by the same Quantity, the Quotient discovers the Rate or Value of the Integer; as if & Yard of Cloth coft 19 Shillings, if you divide (96) the Value or Price of the eiven Quantity by (8) the fame Quantity, the Quotient will be 128, which is the Price or Value of 1 of

those Yards, & contra.

If you divide the Value or Price of any unknown Quantity, by the Value of the Integer, it gives you in the Quotient that unknown Quantity, whose Price is thus divided; as if 12 Shillings were the Value of 1 Yard, I would know how many Yards are worth of Shillings: Here if you divide (96) the price or Value of the unknown Quantity (by 12) the Rate of the Integer, or I Yard, the Quotient will be 8, which is the Number of Yards worth of Shillings.

Some Questions answered by Division, may be these following.

Queft. 1. If 22 Things coft 66 Shillings, what will I fuch thing coft? Facit, 3 Shillings; for if you divide 66 by 22, the Quoriest is 3 for the Answer; so if 26 Yards or Ells of any Thing be bought or fold for 1081. how much will I Yard or Ell be bought or fold for Facis, 3 1. for if you divide 108 1. by 36 Yards. the Quotient will be 3 1. the price of the Integer.

Years amount to 868 !. what is the Expence, Charges r Wages of 1 Year ? Facit, 124 li for if you divide

268,

Years) the Quotient will be 124 l, for the Answer, See the Work.

7) 868 (124 7 16 64: 28 28 38:

2008. 3. If the Content of one superficial Foot 10 244 Inches, and the breadth of a Board be 9 Inches, how many Inches of that Board in length will make such a Foot? Facit, 16 Inches; for by dividing 144 the number of square Inches in a square Foot) by 9 the Inches in the breadth of the Board) the Quotient is 16 for the number of Inches in length of that Board to make a superficial Foot.

9) 144 (16 Inches

Soil. 4. If the Content of an Acre of Ground & so square Perches, and the length of a Furlong (prepounded) be so Perches, how many Perches will there so in breadth to make an Acre? Facit, 2 Perches; for a you divide 160 the number of Perches in an Acre by so state length of the Furlong in Perches) the Quotient is a Perches; and so many in breadth of the Furlong will make an Acre.

Battle, the Front confifts of 47 Mm, what Number must there be in the File? Facir, 19 deep in the File; for if you divide \$93 (the number of Men) by 47 the number in the Front) the Quotient will be 19 File is depth. The Work followeth.

47) 893 (19 deep in File

47

423

423

(0)

Quest. 6. There is a Table whose superficial Contest is 72 Feet, and the breadth of it at the End is 3 Feet; now I demand what is the length of this Table? Facit, 24 Feet long; for if you divide 72 (the Content of the Table in Feet) by 3; (the breadth of it) the Quotient is 24 Feet for the length thereof, which was required. See the Operation as followeth.

3) 72 (24

6

12

12

(a)

The Proof of Multiplication and Division.

Multiplication and Division interchangeably prove ach other; for if you would prove a Sum in Divity, whether the Operation be right or no, multiply the Quotient by the Divisors, and if any thing remain after the Division is ended, add it to the Product, which Product (if your Sum was rightly divided) will be a qual to the Dividend. And contrarywise, if you would prove a Sum in Multiplication, divide the Product by the Multiplier, and if the Work was rightly perform the Quotient will be equal to the Multiplicand. So the Example, where the Work is done and undong Let 7054 be given to be Multiply d by 3242, the Product will be 24814268, as by the Work appeared.

Ch

1

Ron

wii.

dué

in Mu

Mu

if

be al

And then if you divide the fild Product 24314261 by 3242 the Multiplier, the Quotient will be 7654 equal to the given Multiplicand.

3242) 248:4268 (7654

main

hich

ould

2 by

m'L

Ser

one,

Pro

L.

4268

7654

In like manner (to prove a Sum or Number in Divifon) 24814268 were divided by 3242, the Quotient
will be found to be 7644; then for Proof, if you multiply 7654 the Quotiene, by 3242 the Divisor, the Product will amount to 24814268, equal to the Dividend.

Or you may prove the last, or any other Example in Maltiplication thus, wiz Divide the Product by the Multiplicand, and the Quotient will be equal to the

Multiplier. See the Work.

7654 3242 15308 30616 15308 22962

7654) 24814268 (3242

18522 15308 15308 32146 30616

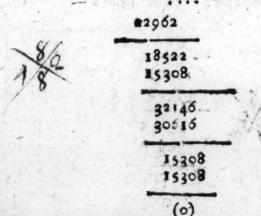

15308

From whence there arise the this Corollary, that any Operation in Division, may be preved by Division; for if afre, your Division is ended you divise the Dividend by the conscient, the new Quorient theorems sing will be equal to the Division of the field Operation; for the all whereof, let the last Example be again repeated.

3,243

Por Proof whereof divide again 24814268 by the Quotient 7654 and the Quotient hence will be equal to the first Divisor 3242. See the Work.

7654) 24814268 (3242

But in proving Division by Division, the Learner is to observe this following Caution; That if after his Division is ended, there be any Remainder; before you go about to prove your Work; subtract that Remainder out of your Dividend, and then Work as in the following Example, where it is required to divide 43876 by 765, the Quotient here is 57, and the Remainder is 271. See the Work following.

## CHAP VIII.

# Of Reduction.

PEDUCTION, is that which brings together two or more Numbers of different Denominations into one Denomination, or it few Hill's Arith. eth to change or alter Numbers, Money 1.13. p. 152. Weight, Measure of Time, from on Denomination to another; and likewish to abridge Fractions to the lowest Terms. All which it doth so precisely, that the first Proportion remains eth without the least jot of Error or Wrong committed; so that it belongeth as well to Fractions as so tegers; of which in its proper Place Reduction is go nerally performed either by Multiplication or Divising from whence we may gather, That

2. Reduction, is either defeending or afcending.

3. Reduction descending, is when it is requir'd to a duce a Sum or Number of a greater Denomination into a lesser; which Number when it is so reduc'd, said be equal in Value to the Number first given in the greater Denomination; as if it were so

Wing. Arith. quir'd to know how many Shillings Pond c. 7. 2, 3, 4. or Farthings are equal in value to and un

dred Pound? Or how many Ounce at contain'd in 45 Hundred Weight? Or how many Lon Hours or Minutes, there are in 440 Name? See: And no kind of Reduction is generally perform'd by Multiplication 4. Reduction at centing is when it is required to be duce or bring a Sum or Number of a tenation. Denomination into a greater, which shall be equivalent to the given Number, as suppose in were required to sind the how many Pounds. Skillings of Ponce, are equal in Vilue to 4785 Fortbings? Or, how many timedreds at equal to (or in) 3748 Pounds, See, and this Kinds Reduction is always perform'd by Division and the Reduction is always perform'd by Division and the state of the state of another Denomination, you are to consider who

31680 Pence

15280

2640

her it ought to be refolv'd by the Rule descending or feending, viz by Maliplication, or Division; if it be obe perform'd by Mulciplication, confider how many parts of the Denomination into which you would rence it, are contained in ah Unit or Integer of the iven Number, and mulciply the faid, given Number hereby, and the Product thereof will be the o the question. As if the question were in 8 Pounds, how many Shillings? Here I consider, that in one Pound are 20 Shillings, 20 nd that the Number of Shillings in 18 ounds, will be 20 times 38, wherefore I 760 nultiply 38 l. by 20, and the Product is 760, nd fo many Shillings are contain'd in 38 Pounds, as n the Margent.

But when there is a Denomination or Denominaions between the Number given and the Number reuir'd, you may (if you please) reduce it into the ext inferior Denomination and then into the next

ower than that, ore until you have rought is into the Denomination equired As for Example, Let it e demanded in 132 Pounds, how nany Farthings? First, I multiply

12 (the Number of Pounds given) y 20 to bring it into Shillings, nd it makes 2640 Shillings, then do

multiply the Shillings 2640 by ; to bring them into Pence, and produceth 31680, and fo many

mee are contained in 2640 Shilgr. or 132 Pounds, then do I manuply the Pence, viz. 31680 by 4 1 126720: Farth.

o bring them into Farthings, (be-

aufe A Forthings is a Peny) and I find the Product hereof to be many 20, and ie many Farthings are equal We so 132 Pounds. The Work is manifelt in

to be divided, or wrought by the Rule alconding, COIL

consider how many of the given Numbers are equal an Unit or Integer in that Denomination to which would reduce your given Number, and make that politifor, and the given Number your Dividend; a the quotient thence arising will be the Number sou

or required; As for Example, let it be required to reduce 2640 Shillings into Pounds. Here I consider that 20 Shillings are equal to one Pound; wherefore I divide 2640 (the given Number) by 20, and the quotient is 132, and so many Pounds are contain'd in 2640 Shillings. In Reduction descending and ascending the Learner is advis'd to take particular Notice of the Tables deliver'd in the second Chapter of this Book, where he may be informed what Multipliers or Divisors to make use

of in the reducing of any Number to any other Demination whatfoever, especially English Money Weights, Measures, Time and Motion; but in the place it is not convenient to meddle with Ferri

Coyns, Weights or Measures.

But if in Redultion afcending it happen that there a Denomination or Denominations between the Number given and the Number required, then you may duce your Number given into the next superior Denomination, and when it is so reduc'd, bring it into next above that, and so on until you have brought into the Denomination sequired. As for Example

Let it be demanded in 126726 Farthings, how mu Pounds? First I divide my given Number (being sethings by 4 to bring them into Pence, (because 4 sethings make one Peny) and there are 31680 Pence the I divide 31680 Pence by 12, and the Quotient gives 2640 Shillings, and then I divide 2640 Shillings to 20 and the Quotient giveth 132 Pounds, which a equal in Value to 126720 Farthings. See the who Work as it followeth.

roats!

720 Si Grand it pr 4386 Pounds

87720 Shillings

3

Facit, 263160 Groats

This Question might have been otherwise resolv'd hus, viz. considering that in a Pound (or 20 Shilings) there are three times 20 Groats which makes o, by which I multiply the Number of Pounds given, and it produceth the same Effect at one Operation, as alloweth.

4386 Pounds 60 Grosts in 12 s.

Facit, 263160 Greats 4386 L.

Queft. 7. In 43758 Three-pences, I delire to know ow many Pounds?

To resolve this, and many such-like Questions; irst, I divide my given Number of Three-pences by because 4 Three-pences are in a Shilling, and the wotient is 10939 Shillings, and there remaineth ster Division is ended, which is 2 Three-pences (by the 8th Rule of this Chapter) which are equal in Value to 6 d. then I divide 10939 Shillings by 20, and the Quotient giveth 546 l. and 19 s. remains; so at I conclude in 43758 pieces of Three-pence perfece, there are 546 l. 19 s. 6 d. as by the Work apareth.

(:) Three-pences, or 6 d.

This Question might have been otherwise resolved thus, viz. First multiply the given Number of 3 pence 43758, by three the number of pence in 3 pence, and the Product (viz. 13174) is the number of pence equal to the given number of 3 pences, which number of pence may be brought into Pounds by dividing by and by 20, and the Quotient you will find to be equal to the former Work, viz., 546 L. 19 s. 6 d.

Queft: 8. In 4885 7.13 s. how many Pieces of 13 de Piece?

This Quefier cannot be refolved by Reduction, deading or alcending, absolutely (herause 131d. is even part of a Pound) but rather by them both ntly, vie by Multiplication and Division; for if bring the number given into balf-pence, and die the half-pence, by the half-pence in 13td. wine the Quatient, will be the Answer; for having

Batio

brought.

m

Per

yo

and

240 YOU

at 4

brought 4785 l. 13 s. into Half-pence, I find it makes 2297112, which I divide by 27. (because there are so many Half-pence in 13\frac{1}{2}d) and the Quote gives \$5078 pieces of 13\frac{1}{2}d. and 6 Half-pence remain over and a bove: Observe the Work following.

3. 3. 4785—13 1 2 1 0 10 13 ½d.

95713 shillings 27 half-pence.
24 half-pence in a shilling

382852 191426

27) 2297112 (85078 pieces of 13 ad.

Rem. (6.) half-pence.

It would have produc'd the same Answer, if you had reduc'd your given Number into Farthings, and divided by the Farthings in 13½d, viz. 54; (for always the Divided and the Divisor must be of one Denomination) and then you would have had a Remainder of 12 Farthings, which are equal in value to the formal Remainder of 6 Half-pence, as you may prove your leisure.

Queft. 9. In 540 Dollars at 41. 4d. per Dollar, how many Pounds Sterling?

First, bring your given number of Dollars into pence, and then your Pence into Pounds according to the former Directions, Thus in 4 s. 4 d. (viz. a Dollar) you will find 52 Pence, by which multiply 540 Dollars, and it produceth 28080 Pence, which if you divide by 240 (the Pence in one Pound) the Quotient will give you 117 l. which are equal in value to 540 Dollars, at 41.4 d. per Dollars,

The foregoing Question might have been otherwise rought, thus; viz. Multiply (540) your given umber of Dollars, by 13 the number of Groats in Dollar (or 4.0. 4 d.) and it produceth 7020 Groats, hich divide by 60 (the Groats in 1 Pound or 20 illings) and the Quote is 117 l. as before. See the lorks

Quef. 11. In 4386 1. I demand how many Pieces of 8d. of 4d and of 2d. of each an equal Number? that is to fay, What number of Six-pences, Groats, and Tow-pences will make up 4386 1. and the number of each equal?

The way to resolve Questions of this Nature, is to add the several Pieces (into which the given Number is to be brought) into one Sum, and to reduce the given Number into the same Denomination with their som, and to divide the said given Number (so reduced) by the said Sum, and the quotient will give you the exact number of each piece. And after the same Method will we proceed to Resolve the present question, viza-

So that I conclude by the Operation that \$7720 Sixpences, and \$7720 Groats, and \$7720 Two pences, are just as much as (or equal to) 4386 L or if you admit of 5 s. to be thus divided, it is equal to 5 Six-pences, and 5 Four-pences or Groats, and 5 Tow pences. For if two Right Lines or two Numbers be given, and one of them be divided into as many Parts or Segments as you please, the Restangle (or Product) comprehended under the two whole Right Lines (or Numbers given) shall be equal to all the Restangles or Products contain d under the whole Line (or Number) and the several Segment: or Parts) into which the other Line (or Number) is divided. Eucl. 2. 1

Another Question of the same Nature with the last,

may be this following, viz.

(o)

Quest. 12. A Merchant is desirous to change 148 linto Pieces of 13 d. \(\frac{1}{2}\) of 12 d. of 9 d. of 6 d. of 4d. and he will have of each Sort an equal Number of Pieces, I desire to know the Number?

Do as you were taught in the last Question, wiz. add the several Pieces together, and reduce the Sum into

Half-

TH

us

erts

uce

er,

So

hic

Cha

Half-

48 l.

nd the P

Half-Vorl falf-pence, then reduce the Sum to be changed, viz.

48 l. into the same Denomination, and divide the reater by the lesser, and in the Quotient you will and the Answer, viz, 798 is the Number of each of the Pieces required, and 18 remaineth, which is 18 falf-pence by the 8th Rule of this Chapter. See the Work as followeth:

l. 148	Andrews (S. 1974) Spirits and a series	d:
240 Pence i	n a Pound	12 -
5920 296		9 6 4
35520 Pena	re in 148 L	Sum 44 1
71040 Hel 89)	f-pence 71040 (798 I	89 Half-penc Pieces of each Sort
	874 801	1.10
	730	

Rem. (18) Half-pence.

712

The Truth of the two foregoing Operations willhus be prov'd, viz. Multiply the Answer by the arts, or Pieces into which the given Number was reuced and having added the several Products togeher, if their Sum be equal to the given Number, the inswer is Right; otherwise not

So the Answer to the 11th Question was 87720; hich is proved as followeth, viz.

\$7720

Six, are it of and or if

thens, the

ne (or which

48 l. l. and leces,

into Halfe

Ch

Po

An

Six-pences make = 2193
Four-pences make 1462
Tow-pences make 731

The Total Sum of them 4386 which as

The Answer to the 12th Question was 798, and 11 Half-pence remain'd after the Work was ended, now the Truth of the Work may be proved as the former was, viz.

Pieces of 13½ makes — 44—17—09
Pieces of 12 makes — 39—18—00
Pieces of 9 makes — 29—18—06
Pieces of 6 makes — 19—19—00
Pieces of 4 makes — 13—06—00

and 18: Half-pence or 9 d. remains — 00—00—09

The Total Sum of them 148-00-00

which Total Sum is equal to the Number that we first given to be changed, and therefore the Operation was rightly performed.

Reduction of Troy-weight.

We now come to give the Learner some Example in Troy-weight, wherein we shall be brief, having given so large a Taste of Reduction in the following Examples of Cayn, and now the Learner must be mindful of the Table of Troy-weight delivered in the second Chapter of this Book.

Queft 13. In 5821. 7 oz. 13 p.w. 21 grs. how min

Grains?

Queft. 15. A Merchant fent to a Goldsmith 16 la gots of Silver, each containing in weight 2 L 4 ez. and order'd it to be made into Bowls of 2 L 8 ez. per Bowl, and Tankards of 1 l. 6 ez. per piece, and Salts of 10 ez. 10 p.w. per Salt, and Spoons of 1 ez. 18 p. w. per Spoon, and of each an equal number; I desire to know how many of each Sort he must make?

This Question is of the same Nature with the 11 and 12th Question foregoing, and may be answered after the same Method, viz. First, add the Weight of the several Vessels (into which the Silver is to be made) into one Sum, and reduce to one Denomination, and they make 1248 penny-weights; then reduce the Weight of the Ingot into the same Denomination, viz. Penny-weights, and it makes 560 Penny-weights) and multiply them by the number of Ingots, viz. 16, and the Produst will give, you the Weight of the 16 Ingots, viz. 960, then divide the Produst by the Weight of the Vessels, viz. 1248, and the Quotient given you the Answer to the Question, viz. 7 and 224 p.z. remaineth ever and above.

Zit.

The Proof of the Work is as followeth, viz.

l. oz. p.w.
l. oz. p.w.

(Bowls of 2 08 00 per Bowl is 18 08 00

Tank. of 1 06 00 per Tank. is 10 06 00

Salts of 0—10 10 per Salt is 06 01 10

Spoons of 0—01 18 per Spoon is 00 01 06

224 penny-weight remaining 00 11 04

Total Sum 37-04-00

So that you see the Sum of the Weight of each Vestel together with the Remainder is 37 4 4 02. which is equal to the Weight of the 16 Ingots deliver'd. For if 17 1. 402. be reduced to Penny-weights it makes 8960.

Reduction of Averdupois-weight.

In reducing Averdupois-weight, the Learner must have recourse to the Table of Averdupois Weight deliver'd in the second Chapter foregoing.

Queft 16. In 47 G. 1 gr. 20 l. how many Ounces? Multiply by 4, by 28, and 16 and the last Product

ier, 1

y, or

2. Relation of Numbers in Quantity, is the reference or respect that the Numbers themselves have one to another, where the Terms Vid. Wing. 2. or Numbers propounded are always rith. cap. 34. two, the first call'd the Antecedent, and the other the Confequent.

1. The Relation of Numbers and Quantity confifes in the Differences, or in the Rate or Reason that is found betwixt the Terms propounded, the Differences

of two Numbers being the Remainder found by Subtraction, but the Rate or Reeson betwixr two Numbers is the mas. lib. 2. C. Quotient of the Antecedent divided by the Consequent, so 21 and 7 being

Alfted Mashe-11, 0 12,

given, the Difference beswixt them will be found to be 14, but the Rate or Reason that is betwixt 21 and 7. will be found to be triple Reason, for 21 divided by 7, quotes 3, the Reason or Rate.

4. The Relation of Numbers in Quality (otherwise call'd Proportion) is the reference or respect that the Reason of Numbers have one unto another; therefore the Terms given ought to be more than two. Now the Proportion or Alfted. Mathe-

Reason between Numbers relating one mat. lib. 2. c. to another, is either Arithmetical, or 21.

Geometrical.

5. Arithmetical Proportion (by fome call'd Progresfion) is, when divers Numbers differ one from another by equal Reason, that is, have equal Differences.

So this Rank of Numbers 3, 5, 7, 9, 11, 13, 15, 17, differ by equal Reason, viz. by 2, as you may prove.

6. In a Rank of Numbers that differ by Arithmetical Proportion, the Sum of the first and last Term being multiply'd by half the number of Terms, the Product is the total Sum of all the Terms.

Or, if you multiply the number of the Terms, by the half Sum of the first and last Terms, the Product is

the total Sum of all the Terms.

So in the former Progression given, 3 and 17 is 20, which multiply'd by 4, viz. half the number of Terms the

Chap. 9. the Product gives 80, the Sum of all the Terms; or multiply 8 (the Number of Terms) by to (half the Sum of the first and the last Term) the Product gives 80, as before.

So alfo, 21, 18, 15, 12, 9, 6, 3, being given, the Sum of all the Terms will be found to be 84; for here the Number of Terms is 7, and the Sum of the first and last (viz. 21 and 3) is 24, half whereof (viz. 12) multiply'd by 7, produceth 84, the Sum of the Terms fought.

7. Three Numbers that differ by Arithmetical Pro. portion, the Double of the Mean (or Middle Number)

is equal to the Sum of the Extreams.

So 9, 12. and 15, being given the double of the Mean 12 (viz 24) is equal to the Sum of the two Ex-

treams 9 and 15.

8. Four Numbers that differ by Arithmetical Proportion (either contain'd or interrupted) the Sum of the two Means is equal to the Sum of the two Extreams.

So 9, 12, 18, 21, being given, the Sun of 12 and 18, will be equal to the Vide Wing. A-Sum of 9 and 21, viz. 30; also 6,8, rith. cap. 35. 14, 16, being given, the Sum of 8 and 14, is equal to the Som of 6 and 16, viz. 22, 60

9. Geometrical Proportion (by some called Geome trical Progression is when divers Numbers differ ac-

cording to right Reason.

So 1, 2, 4, 8, 16, 32, 64, &c differ by Double Reason. And 3, 9, 27, 11, 243, 729, differ by Triple Reason; 4, 16, 64 256, &c. differ by Quadruple Rea

10n, Oc.

10. In any Numbers that increase by Geometrial Proportion, if you multiply the last Term by the Que tiene of any one of the Terms divided by anotherd the Terms, which being less is next unto it, and having deducted, or subtracted the first Term out of that Product; divide the Remainder by a Number that's an Unit less than the said Quotient, the last Quote will give the Sum of all the Terms.

Ch S

ven, 8. 3 lefs, Quo laft'

See 1 11 nals qua

So Viz. Extr

the I

12 iver rod So

13u seq

4006

3)4092(1364

So 1, 2, 4, 8, 16,-32, 64, being given, first I take one of the Terms, viz. s, and divide it by the Term which is lefs, and next to it, (viz, by 4) and the Quotient is 2, by which I multiply the left Term 64, and the Product is 128. from whence I fubtract the first Term, 1) 127 (127 (viz. 1) the Remainder is 127, which divided by the Quotient 2 made less by 1, (viz. 1) the Quote is 127, for the Sum of all the given Terms, as by the Work in the Margent.

So if 4, 16, 64, 256, 1024, were given, the Sum of all the Terms will be found to be 1364. For first, I divide 64, one of the Terms, by his next leffer Term. and the Quotient is 4, by which I multiply the last Term 1024, and it produceth 1096; from whence I fubtract the first

Term 4, and the Remainder is 4092, which I divide by the Quote less by 1,

(viz 3) and the Quate is 1364, for the total Sum of all the Terms, as per Margent.

So likewise if 2 6, 18, 54, 162, \$86 were given, the Sum or total of if the Terms will be found to be 728. See the Work.

11. Three Geometrical proportiohals given, the Square of the Mean is qual to the Rectangle or Product of 2) 1456 (728 he Extreams.

So 8, 16, 32, being given, the Square of the Mean. viz. 16 is 256, which is equal to the Product of the Extreams 8 and 32, for 8 times 32 is equal to 256

12. Of Four Geometrical Proportional Numbers iven, the Product of the two Means is equal to the Product of the two Extreams.

So 8, 16, 32, 64. being given, I fay, that the Prouct of the two Means, viz. 16 times 32, wich is 512, s equal to 8 times 64, the Product of the Extreams.

Nun

rill

hic

Also if 3, 9, 21, 69, were given (which are interrupted) I say, 9 times 21 is equal to 3 times 63, which is equal to 180.

From hence ariseth that precious Gem in Arithmetick, which for the Excellency thereof is call'd the

Golden Rule, or Rule of Three.

## CHAP. X.

The Single Rule of Three Direct.

HE Rule of Three (not undeservedly called the Golden Rule) is that by which we find out a fourth Number in proportion unto three given Numbers, (so as this fourth Number sought may bear the same Rate, Reason and Proportion to the third (given) Number, as the second doth to the first, from whence it is call'd the Rule of Proportion.

2. Four Numbers are faid to be Proportional, when the first containeth, or is contained by the second, a often as the third containeth or is contained by the sourth. Vide Wingates's Arith. Chap. 8. Sect. 4.

So these Numbers are said to be Proportionals, viz. 376, 9. 18.; for as often as the first Number is contained in the second, so often is the third contained in the fourth, viz. twice. Also 9, 3, 15, 5, are said to be Proportionals; for as often as the first Number containeth the second, so often the third Number containeth the fourth, viz, 3 times.

3. The Rule of Three, is either Simple or Compound.

4. The Simple (or Single) Rule of Three consistests of 4 Numbers; that is to say, it hath 3 Numbers given to find out a fourth, and is this either Direct or law verse. Vide Alfied. Matth. lib. 2. c. 13.

5. The Single Rule of Three Direct is, when the Proportion of the first Term is to the second, as the third is to the fourth, or when it is requir'd that the Number

d to

nber

con-

und.

feth iven

c Inc

Pro-

hird

nbet ugh ought (viz.) the fourth Number must have the same reportion to the second, as the third hath to the first.

6. In the Rule of Three, the greatest difficulty is (after the Question is propounded to discover the order of the 3 Terms, viz. which is the first, which is the second, and which the third, which that you may

f the 3 Terms, viz. which is the first, which is the econd, and which the third, which that you may inderstand, observe, That (of the three given Numbers) two always are of one Kind, and the other is of the same Kind with the Proportional Number that is fought; as in this Question, viz. if 4 Yards of Cloth off 12 Shillings, what will 6 Yards cost at that rate 2. Here the two Numbers of one kind are 4 and 6, viz. they both signify so many Yards, and 12 Shillings is the same Kind with the Number sought, for the price

f 6 Yards is fought.

Again observe, that of the 3 given Numbers those wo that are of the same kind, one of them must be the irft, and the other the third, and that which is of the me kind with the Number fought, must be the second Number in the Rule of Three, and that you may know which of the faid Numbers to make your first, and which your third, know this, that to one of these two Numbers there is always affixed a Demand; and that Number upon which the Demand lieth must alway be eckon'd the third Number. As in the foremention'd Question, the Demand is a ffixed to the Number 6, for t is demanded, what 6 Yards will cost, and therefore must be the third Number, and 4 (which is of the ame denomination or kind with it) must be the first, nd consequently the Number 12 must be the second, nd then the Numbers being placed in the forementined Order will stand as followeth, viz.

yards. s. yards.

7. In the Rule of Three Direct (having placed the Number as is before directed, the next thing to be done will be to find out the fourth Number in Proportion, which that you may do, multiply the second Number

by the third, and divide the Product thereof by the first, or (which is all one) multiply the third Term (or Number) by the second, and divide the Product there of by the first, and the Quotient thence arising is the 4th Number in a direct Proportion, and is the Number sought, or Answer to the Question, and is of the same Denomination that the second Number is of. As thus, Let the same Question be again repeated, viz If 4 Yards of Cloth cost 12 Shillings, what will 6 Yards cost?

Having placed my Numbers according to the fixth Rule (of this Chapter) foregoing, I multiply (the fecond Number) 12 by (the third Number) 6, and the Product is 72, which Product I divide by (the find Number) 4, and the Quotient thence arising is 11, which is the 4th Proportional or Number fought, vit. 18 Shillings, (because the second Number is Shillings) which is the price of Yards, as was required by the

Question. See the Work following.

19 4 12 6 18 4 72 6 18 4) 72 (18 Shillings 32 32 32 (0)

Duest. 2. Another Question may be this, viz. If 7 C. of Pepper cost 21 l. how many will 16 C, cost at

that Rate?

To resolve which Question, I consider that (according to the fixth Rule of this Chapter) the Terms or numbers ought to be plac'd thus viz. the Demand lying upon 16 C it must be the third Number, and that of the same Kind with it must be the first, viz. 7 C. and 21 l. (being of the same Kind with the Number sought) must be the second Number in this Question; then I proceed according

Number by the third, viz. 21 by 16 and the Product is 336, which I divide by the first Number 7, and the Quotient is 48 l. which is the Value of 16 C. of Pepper at the rate of 21 l. for 7 C. See the Work following.

8. If when you have divided the Product of the feond and third Numbers by the first, any thing remain fter Division is ended, such Remainder may be muliply'd by the parts of the next inferior Denomination, hat are equal to an Unit (or Integer) of the fecond Number in the Question, and the Product thereof diide by the first Number in the Question, and the Quoent is of the same Denomination with the parts by thich you multiply'd the Remainder, and is part of he fourth Number which is fought. And furthermore, any thing remain, after this last Division is ended, sultiply it by the parts of the next inferior Denomiation equal to an Unit of the last Quotient, and diide the Product by the same Divisor, (viz. the first lumber is the Question) and the Quote is still of the me Denomination with your Multiplier; follow this ethod until you have reduced your Remainder into e lowest Denomination, &c. An Example or two will

e. If

ns or lying of the

muk occeed

rding

will make this Rule very plain, which may be the following.

Queft. 3. If 13 Yards of Velvet (or any other Thing) cost 21 l. what will 27 Yards of the same cost at that rate?

Having ordered and wrought my Numbers accord. ing to the 6th and 7th Rules of this Chapter, I find she Quotient to be 43 L and there is a Remainder of 8. fo that I conclude the price of 27 Yards to be mon than 43 1 and to the Intent that I may know how much more, I work according to the foregoing Rule viz. I multiply the faid Remainder 8 by 20% fbe cause the second Number in the Question was Poundal and the Product is 160, which divided by the first Number, viz. 13, it quotes 12, which are 12 Shillings and there is yet a Remainder of 4, which I multiply by 12 Pence, (because the last quotient was Shill lings) and the Product is 48, which I divide by n (the first Number) and the Quotient is 3 d. and yet there remaineth 9, which I multiply by 4 Farthings and the Product is 36, which divided by 13 again it quotes 2 Farthings, and there is yet a Remainder of 10, which (because it cometh not to the Value of Farthing) may be neglected; or rather fet after the 2 Farthings over the Divisor, with a Line between them; and then (by the 21st and 22d Definitions of the first Chapter of this Book) it will be 18 of a Fatthing; so that I conclude, that if 13 Yards of Velve cost 21 1. 27 Yards of the same will cost 43 1. 121.34 2 12 grs which Fraction is to thirteens of a Farrhing See the Operation as followerh.

. In

o. In the Rule of Three it many times happeneth, that although the first and third Numbers be Homogeneal (that is, of one Kind) as both Money, Weight, Meafure, &c. yet they may not be of one Denomination, or perhaps they may both confist of many Denominations; in which Case you are to reduce both Numbers to one Denomination; and likewise your second Number (if it consisted at any time of divers Denominations) must be reduced to the least Name mention'd, or lower if you please, which bein done, multiply the second and third together, and divide by the first, as is directed in the 7th Rule of this Chapter.

And note, That always the Answer to the Question is in the same Denomination that your second Number is of, or is reduced to, as was hinted before.

Quest. 5. If 15 Ounces of Silver be worth 3 1. 15 .

what are 86 Ounces worth at that rate?

In this Question, the Numbers being ordered according to the 6th Rule of this Chapter, the first and third Numbers are Ounces, and the second Number is of divers Denominations, viz. 3 l. 15 s. which must be reduced to Shillings, and the Shillings multiply'd by the third Number, and the Product divided by the first, gives you the Answer in Shillings, viz. 430 Shillings, which are reduced to 21 l. 10 s.

In

ORC

that

into

If

H

In refolving the last Question, the Work would have been the same, if you had reduc'd your second Number into Pence, for then the Answer would have been \$160 Pence equal to 21 l. 10 s. or if you had reduc'd the second Number into Farthings, the Quotient of Answer would have been 20640 Farthings, equal to the same, as you may prove at your Leisure.

Quest. 6. If 8 l. of Pepper cost 4 s. 8 d. what will 70, 3 grs. 14 l. cost? In this Question the first Number is 8 l. and the third is 7 C. 3 grs. 14 l. which must be reduced to the same Denomination with the first, viz. into Pounds, and the second Number must be reducid into Pence; then multiply and divide according to the 7th Rule foregoing, and you will find the Answer to be 6174 Pence, which is reduced into 25 l. 14 s. 6 d.

1. s. d. C. qrs. 1.

fay,

Pro-

divile he ivilor Divisor is bigger than the Dividend; wherefore bring the 73 1. into Shillings, and they make 1460, which divide by the first Number 363, and the Quote is 4 Shillings for the Answer : As you fee in the Work.

Quest. 10. A Merchant bought 14 Pieces of Broad-Cloth, each Piece containing 28 Yards, for which he give after the Rate of 13 s. 6 1 d. per Yard; now I defire to know how much he gave for the 14 Pieces at that Rate?

First find out how many Yards are in the 14 pieces, which you will do if you multiply the 14 pieces by 28 (the number of Yards in a piece) and it makes 392; then fay, If 1 Yard cost 13 s. 6 d. 1 what will 392 Yards cost? Work as followeth, and the Answer you will find to be 127400 Half-pence, which reduced make 265 1. 8 s. 4 d. For after you have multiply'd your fecond and third Numbers together, the Profull is 127400, which (according to the seventh Rule) hould be divided by the fift Number; but the first Number is 1, which neither multiplyeth nor divibeth, and therefore the Quotient or fourth Number s the fame with the Product of the fecond and third ; which is in Half pence, because the second Number was so reduced. See the Work as followeth.

els t

And

and I

ifor ;

Always observing, that if any Thing remain the you have divided the Product of the second and the Numbers by the first, such Remainder in proving a same, must be added to the Product of the first a fourth Numbers, whose Sum will be equal to the product of the second and third (the second Number being of the same Denomination with the fourth, in the first of the same Denomination with the third)

repeated, viz If 14 l. of Tobacco cost 27 s. what will 478 l. cost at that Rate? The Answer (or fourth Nomber) was 46 l. 1 s. ro d. 1 gr. . 4, which is thus proving bring the fourth Number into Farthings, and makes 44249, which multiply'd by the first Number 4, produceth 619488, (the second which remainer being added thereto;) then (because I reduce message added thereto;) then (because I reduce message added thereto;) into Farthings) I reduce my second (viz. 27 s.) into Farthings, and they are 1296, which multiply'd by the third Number 478, their Products of the first and sour Numbers. Wherefore I conclude the Operation to be true. This is an infallible Way to prove the Russes Three Direct, and it it is deduced from the 12th Section of the 9th Chapter of this Book.

Thus much concerning the Single Rule of Three Is rest; and I question not but that by this Time in Learner is sufficiently qualify'd to resolve any qualiform pertinent to this Rule, not relying upon sufficiently qualify'd to resolve any qualiform of Geometrical Magnitudes. Those that is desirous to see the Demonstration of this Rule, is them read the sixth Chapter of (the Ingenious) Makersey's Appendix to Mr. Wingate's Arithmetick; the 5th Chapter of Mr. Oughtred's (incomparable) Chapter of the 7th Book of Euclid. Rule

the 19

HA

# on The Single Rule of Three Inverse. and the work Collision adong to the Relation

HE Golden Rule, or Rule of three Inverse, is when there are 3 Numbers given to find a archin fuch proportion to the 3 given Numbers, fo the 4th proceeds from the 2d according to the fame Realon, or Proportion, that the first proceeds om the third, or the Proportion is,

As the third Number is in proper- Alfred. Math. on to the second, fo is the first to lib. 2. cap. 14. e fourth. TO SEE

So if the 2 Numbers given were 8, 12, and 16, and were required to find a fourth Number in an invertproporcion to thefe, I fay, that as 16 (the third imber) is the double of the fir ft Term or Number (8) must 12 (the second Number) be the double of the inth; fo will you find the fourth Term or Number be 6. And, as in the Rule of Three Direct, you mulhe the fecond and third together and divide their oduct for a fourth Proportional Number.

In the Rule of Three Inverse, you must multiply fecond Term by the first (or first Term by the fend)and divide the Product thereof by the first Term. the Quotient will give you the fourth Termfought n inverted Proportion. The fame order being obof Three Direct, for cing and disposing of the given Numbers, and after Numbers are placed in order, that you may know ther your Question be to be resolved by the Rule ed or Inverse, observe the general Rule following. . When your Question is stated, and your Numbers erly dispos'd, Consider, in the first place, whether fourth Term or Number fought, ought to be more els than the second Term; which you may easily And if it is requir'd to be more or greater than the and Term, than the leffer Extream must be your ifor; but if it require less, then the highest Ex-OTHER DESIGNATION OF THE CLEAN

24

tream must be your Divisor in this Case) the ist in 3d Numbers are call'd Extreams in (respect of the 2d an having found out your Divisor, you may know whether your Question belong to the Rule Direct anverse, for if the third Term be your Divisor, the it is Inverse; but if the 1st Term be your Divisor, the it is a Direct Rule. As in the following Questions.

Work in 12 Days, in how many Days will 16 Labor

ers do the fame ? Anfwer, In 6 Days.

Having placed the Numbers according to the fur Rule of the tenth Chapter, I confider, that if 8 Men can finish the lab. days. lab. Work in 12 Days, 16 Men will do 8 12it in leffer or (fewer Days than 12) therefore the biggeft Extream must 16) 96 (6 1 be the Divisor, which is 16, and therefore it is the Rule of Three Inverfe: wherefore I multiply the (o) first and second Numbers together, wig. 8 by 12, and their Product is Facit, 6 days 96, which divided by 16, quotes

Days for the Answer; and in so many Days w

can do it in 12 Days.

Questi 2. If when the Measure (viz. a Peck)
Wheat cost 2 Shillings, the Penny-Loaf weighed (a cording to the Standard Statute, or Law of England Ounces, I demand how much it will weigh whe the Peck is worth 1 2 6 d according to the same Re-or Proportion? Answer, 10 ez. 13 p.w. 8 gr.

Having placed and reduced the given Numbers cording to the 6th and 9th Rules of the 10th Chapter confider that at 1,6 d. per Peck, the Penny-Loafs weigh more than at 2, per Peck; for as the Price creafeth, the Weight increafeth; and as the Price creafeth, so the Weight diminishes; wherefore been the first Term requires more than the second, the less than the second, the less than must be the Divisor, viz. 1, 6 d. or 18d thaving finish'd the Work, I find the Answer to be 10

s. pieces s. If 12 240 20 480 240 2 0188 0 ( 144 pieces at 20 s. per piece. 8 3 8 8 (0

Queft. 4. How many Yards of 3 Quarters broad, are required to double, or be equal in Measure to 30 Yards, that are grs. long Quarters broad? Answer, 50 Yards. For fay, if 5 Quarters wide require 30 Yards long, what length will 3 Quarters broad require? Here I consider that 3 Quarters broad will require more Yards than 30; for the narrower the Cloth is, the more in length will go to make equal Measure with a broader Piece.

gri. -30--3 3) 150 (50 yds. 15 (0)

Queft. 5. At the Request of a Friend, I lent him 2001. for 12 Months: Promising to do me the like Courtefy at my Necessity; but when I came to tequest it of him, he could let me have but 150 1. now. I defire to know how long I may keep this Money to make plenary Satisfaction for my former Kindness to my Friend? Answer, 16 Months. I say, If 2001. will require 12 Months, what will 150 1. require? 1501 will require more Time than 12 Months, therefore the leb fer Extream, (viz. 150) must be the Divisor, multiply

ad divide, and you will find the fourth inverted proreional to be 16, and so many Months I ought to cep the 150 L. for Satisfaction.

Queft. 6. If for 24 s. I have 1200 ! Weight carry's 6 Miles, how many Miles shall 1800 I be carry'd for

the sime Money? Auswer, 24 Miles.

Queff 7. If for 24 s I have 1200 L Weight carry'd 36 Miles, how many Pound Weight shall I have carry'd 24 Miles for the same Money? Answer, 1800 L. Weight.

Queft. 8. if 100 Workmen in 12 Days finish a piece of Work or Service, how many Workmen are fufficient to do the same in 3 Days? Answer, 400 Workmen.

Quell. o. A Colonel is besieg'd in a Town in which are 1000 Soldiers with Provision of Victuals only for Months, the Question is, How many of his Soldfers must he dismiss, that his Victuals may last the remaining Soldiers 6 Months? Answer, 500 he must keep, and difmifs as many.

Queft. 10 If Wine worth 20 1. is fufficient for the Ordinary of 100 Men, when the Tun is fold for 30 L. how many Men will the fame 20 I worth fuffice when

the Tun is worth 241? Answer, 125 Men.

Queff. 11. How much Plush is sufficient to line a Clock, which hath in it 4 Yards of 7 Quarters wide, when the Plush is but 3 quarters wide? Answer, 9 Yards of plush.

Queft. 12. How many Yards of Canvas that is Ell wide, will be sufficient to line 20 Kards of Say, that

is 3 quarters wide ? Answer, 12 Yards.

Queft 13. How many Yards of Matring that is two Foot wide, will cover a Floor that is 24 Foot long,

and 20 Foot broad? Answer, 240 Foot.

Quell. 14. A Regiment of Soldiers confishing of 1000, are to have new Coats, and each Coat to contain a Yards 2 quarrers of Cloth, that is 5 quarters wide, and they are to be lined with Shalloon that is a quarters wide. I demand how many Yards of Shalloon will line them? Answer, 16666; quarters, or 41662 Yards.

Queft. 15. A Messenger makes a Journey in 24 Days when the Day is 12 Hours long. I defire to know in how many Days he will go the fame when the Day is 16 Hours long? Answer, In 18 Days.

Queft. 16. I borrowed of my Friend, Months, and he harh occasion another time to borrow of me for 12 Months, I defire to know how much ! must lend to make good his former Kindness to me? Anfwer, 42 1. 13 1. 4 d.

4. The general Effect of the Rule of 3 Inverse, is contained in the Definition of the same, that is, to finds fourth Term in a Reciprocal proportion inverted to

the proportion given.

The fecond Effect is, by two prices or Values of two feveral pieces of Money and Merchandizes known to find how many pieces of the one price is to be given for so many of the other. And consequently to reduce and exchange one fort of Money or Merchandin into another. Or contrariwise, to find the price un. known of any piece given to exchange in Reciprocal

proportion.

The 3d effect is, by two different prices of a Mesfure of Wheat bought or fold, and the Weight of the Loaf of Bread, made answerable to one of the prices of the Measure given, to find out the Weight of the same Loaf answerable to the other price of the faid Measure given. Or contrariwise, by the two feveral Weights of the same priced Loaf, and the price of the Measure of Wheat answerable to one of those Weights given, to find out the other price of the Measure answerable to the other Weight of the sim Loaf.

The fourth Effect, is, by two Lengths, and one Breadth of two Rectangular Plains known, to find out another Breadth unknown. Or by two Breadths and one Length given, to find out another Length w known in an inverted Proportion.

The fifth Effect, is, by double Time, and a capital Sum of Money borrowed or lent, to find out another captital Sum answerable to one of the given Times yi, y in

or E

TOW

ch I

me?

con.

ind a

otherwise, by two capital Sums, and a Time an" werable to one of them given, to find out a Time an werable to the other capital Sumin reciprocal Reason"

The fixth Effect is, by two different Weights of Carriage, and the distance of the Place in Miles or in leagues given, to find another distance in Miles answerable to the same price of Payment; Or otherwis by two diffances in Miles, and the Weight answerson to one of the distances (being carry'd for a certain. price) to find out the Weight answerable to the other distance for the same price.

The Seventh Effect, is, by double Workmen, and the Time answerable to one of the Numbers of Workmen given, to find out the Time answerable to the other Number of Workmen, in the performance of any Work or Service. Or contrariwife, by double Time, nd the Workmen answerable to one of those Times eiven to find out the Number of Workmen answerable othe other Time, in the performance of any Work

or Service.

Also by a double price of Provision and the number of Men, or other Creatures nourish'd for a certain Time answerable to one of the prices of Provisions giren, to find out another number of Men er other Creaures answerable to the other price of the Provision for he same Time. Or contrariwise, by two Numbers of Men or other Creatures nourish'd, and one price of rovision answerable to one of the Numbers of Crea-ures given, to find out the other price of the same: revision answerable to the other number of Creatures. oth being suppos'd to be nourish'd for the same, &c. s in the foregoing Examples is fully declar'd.

To prove the Operation of the Rule of Three Inverse, whiply the third and fourth Terms together, and note heir product; and multiply the first and second togeher, and if their product is equal to the product of the hird and fourth, then is the Work truly wrought, but

capital fit falleth otherwise, then it is erroneous.

As in the first Question of this Chapter, 16 (the this Times lumber) being multiply'd by 6 (the fourth Number)

the Product is 96, and the Product of 8 (the Number) multiply'd by 12 (the fecond Number 96, equal to the first Product, which proves the W

to be right.

And note That if in Division any thing remain, Remainder must be added to the Product of the and fourth Terms, and if the Sum be equal to the dust of the first and second (the Homogenial Ter being of one Denomination) the Work is right.

## CHAP. XII.

The Double Rule of Three Direct.

E have already delivered the Rule of Sin Preportion, and we come now to lay do

the Rules of Plural Proportion.

Plural Proportion, is, when more Operation the Rule of Three than one are required before a Soluti can be given to the Question propounded. Therefore in Questions that require Plurality in Proporti there are always given more than 3 Numbers.

2. When there are given 5 Numbers, and a fixth required in Proportion thereunto, then this fixth ? portion is faid to be found out by the Double Rake

Three, as in the Question following, viz.

If 100 l. in 12 Months gain 6 l. Interest, how mo

will 75 l. gain in 9 Months?

7. Questions in the Double Rule of Three, may be Polved either by two Single Rules of Three, or by one! the Rale of Three, compounded of the 5 given Number

4. The Double Rule of Three, is either Direst, ore

Inverte.

4. The Double Rule of Three Dires, is, when unto iven Numbers, a fixth Proportional may be fou out by two Single Rules of Three Direct.

The given Numbers in the Double Rule

tion, and Secondly, of a Demand; the Supposition is contain'd in the three first of the five given Numbers and the Demand lies in the two last; as in the Estable of the second Rule of this Chapter, viz. if 100 l. 12 Months gain 6 l. Interest, what will 75 l. gain in Months? Here the Supposition is express in 100, 12, and 6; for it is faid, if 100 l. in 12 Months gain 6 l. Interest: And the Demand lieth in 75 and 9; for it is demanded, how much 75 l. will gain in 9 Months?

7. When your Question is stated, the next Thing All be to dispose of the given Numbers in due order nd place, as a Preparative for Resolution: which that ou may do; First, observe which of the given Numers in the Supposition is of the same Denomination with the Number requir'd; for that must be the feand Number (in the first Operation) of the Single Rule of Three, and one of the other Numbers in the Supolition (it matters not which) must be the first Nume er, and that Number in the Demand which is of the ame Denomination with the first, must be the third-Number; which three Numbers being thus plac'd, will take one perfect Question in the Single Rule of Three. s in the fore-mention'd Example: First, I consider, hat the Number required in the Question, is the Interest or Gain of 7511. wherefore that Number in the apposition which hath the same Name (viz. 61) which is the Interest or Gain of 100 1. 100 6-75 must be the second Number in the first Operation, and either 100 or 12 (it : matters not which) must be the first Number ; but I will take 100, and then for the third Number I put hat Number in the Demand, which hash the fame : Denomination with 100, which is 75; ffor they both ignify Pounds principal) and then the Numbers will

hand as you fee in the Margent.

11

But if I had for the 1st Number put the other Number in the Supposition, viz. 12, which signifies 1 Months, then the third Number must have been 9, which is the Number in 100-6-the Demand which hath the same Denomination with the first, viz. 9 Months; and the they will stand as in the Margent.

There yet remain two Numbers to be disposed of and those are one in the Supposition, and another in the Demand; that 100-6-18 which is of the Supposition, I place 12 under the first of the three Numbers, and the other, which is the Demand, I Or this, place under the third Number; and then two of the Terms in the Suppo-

in the first place, and the two Terms in the Demand, will stand (one over the other) in the

third place, as in the Margent.

fition will stand (one over the other)

8. Having dispos'd or order'd the given Numbers to cording to the last Rule, we may proceed to a Resolu tion; and first I work with the 3 uppermost Number which according to the first Disposition are 100, 6 and 75, which is as much as to fay, if 100 l. require 61 (Interest) how much will 75 1. require? Which by the ad Rule of the 11th Chapter, I find to be Direct, and by the 7th and 8th Rules of the 10th Chapter, I find the 4th Proportional Number to be 41. 10 s. fo that by the foregoing fingle Question I have discover'd how much Interest 75 1. will gain in 12 Months; the Operation whereof followeth on the Left Hand under the Lette A, and having discover'd how much 75 1. will gain it 32 Months, we may by another Question easily discover how much it will gain in 9 Months; for this 4th Num ber (thus found) I put in the middle between the two lowest Numbers of the safter they are plac'daccording to the 7th Rule of this Chapter; and then it will be ad Number; in another Question in the Rule of Three

The Numbers being 12-4-10-9 the first and third Numbers

Numbers being of one Denomination, viz. both Months,

nd may be thus express d; If 12 Months require 41. he id Rule of the 11th Chapter, I find it to be the Direct Rule, and by working according to the Directions laid down in the 7th,8th and 9th Rules of the 1eth

Chapter, I find the fourth Proportional Number to the

of Single Question, to be 3 1. 7 1. 6 d, which is the fixth Proportional Number to the 5 given Numbers, and is the Answer to the general Question. The Work

of the laft Single Queftion is express'd on the right Side of the Page under the Letter B, as followeth.

12 1. Then fay. If 100 75 1. 6 30 90 Millings 12 1700) 4/50 (4--10 081 90 1080 pence Rem. (50) Mult. 20 12) 2 0 l. s. d. 1100 (10|00 (10 1. 12) 9720 (810 (67 (3-7-6.

12 12 84

> (0) (6) Pence.

f Three nd third umber

For first, I say, if 12 Months gain 6 h what will Months gain? This Question I find to be Direct byth ad Rule of the 11th Chapter, and by the 7th and 1 Rules of the roth Chapter, I find the fourth Propage

tional Number to these three to be 4 1. 10 s.

J 44

Thus I have found out what is the Interest of 100 for 9 Months, and I am now to find the Interest of 75 for 9 Months, to effect which I make this 4th Number (found as before) to be my fecond Number in the new Question, and say, if 100 l. require 4 l. 10 s. what will 75 1. require? This Question, I find (by the faid ; Rule of the 11th Chapter) to be Direst, and by the faid 7th, 8th and 9th Rules of the 10th Chapter, find the Answer to be as before, viz. 3 1. 7 s. 6 d.

This Rule hath been sufficiently explain'd by the foregoing Example; fo that the Learner may be able to refolve the following (or any other) Question spen tinent to the Double Rule of Three Direct, whose An fwers are there given; but the Operations are pur posely omitted to try the Learner's Ability in the Knowledge of what has been before deliver'd.

Queft. 2. A second Example in this Rule may be u followeth, viz. A Carrier receiving 42 Shillings forth Carriage of 300 Weight 150 Miles, I demand how much he ought to receive for the Carriage of 7 C.1 grs. 14 1. 50 Miles at that rate? Answer, 36 s 9 d.

Queft. 3. A Regiment of 136 Soldiers eat up 359 Quarters of Wheat in 108 Days, I demand how many Quarters of Wheat 11232 Soldiers will eat in 56 Days at that Rate ? Answer, 1404 Quarters

Queft. 4. If 40 Acres of Grafs be Mow'd by 8 Men, in 7 Days, how many Acres shall be Mow'd by 14

Men in 28 Days? Answer, 480 Acres.

Answer, 17280 Bushels.

Quel. 6. If 40 Shillings is the Wages of 8 Men for 24 Days, what will be the Wages of 32 Men for 24 Days? Answer, 768 Shillings, or 38 1 8 s.

guest. 7. If 14 Horses eat 56 Bushels of Provender in 16 Days, how many Bushels will 20 Horses eat in

24 Days? Answer, 120 Buffels.

Queft. 8. If 8 Cannons in one Day Spend 48 Barrels of Powder, I demond how many Barrels 24 Cannons will spend in 22 Days at that Rate? Answer, 1728 Barrels.

Quest. 9. If in a Family consisting of 7 Persons, there are drunk out 2 Kilderkins of Beer in 12 Days, how many Kilderkins will there be drunk out in 8 Days by another Family confissing of 14 Persons? Another, 48 Gallons, or 2 Kilderkins and 12 Gallons.

Quest. 10. An Usurer put 75 l out to receive Interest for the same, and when it had continu'd 9 Months he received for principal and Interest 78 l. 7 s. 6 d. I demand at what Rate per Cent. per Annum, he received

Intereft ? Answer. 6 1. per Gent. per Annum.

## CHAP. XIII.

The Double Rule of Three Inverse.

THE Double Rule of Three Inverse, is, when a Question in the Double Rule of Three is resolved by two Single Rules of Three, and one of those Single Rules falls out to be Inverse, or requires a fourth Number in Proportion Reciprocal (for both Questions are never Inverse.)

s. In all Questions of the Double Rule of Three (as well Inverse as Dires) you are in the dispoint of the 5

given

First

chapter, and in refolving of it by two Single Rules, observe to make choice of your Numbers for the first and second single Questions, according to the Directions given in the 8th Rule of the same Chapter, and in the Example following, viz.

Queft. 1. If 100 l. Principal in 12 Months gain 61. Interest, what Principal will gain 3 1. 7 1. 6 d. in a

Months ?

This Question is an Inversion of the first Question of the 12th Chapter, and may serve for a Proof thereof.

In order to a Resolution, I dispose of the 5 given Numbers according to the 9th Rule of the last Chap, ter; and being so dispos'd, they will stand as solloweth.

Or thus,

Here observe, That according to the 8th Rule of the 12th Chapter, the first Question, if you take it from the 5 Numbers (as they are ordered or placed first) will be, if 12 Months require 100 st. Principal, what will 7 Months require to make the same Interest? This (according to the 3d Rule of the 11th Chapter) is sinverse, and the Answer will be found (by the 2d Rule of the 11th Chapter) to be 133 st. 8 d. The 2d Question then will be, If 6 s. Interest require 133 st. 6 st. 8 d. Principal, how much Principal will 3 st. 7 st. 6 d. require? This is a Direct Rule, and the Answer ima Direct Proportion, is 75 st. See the Work.

of Three Inverse. 137 LongT First I fay, 777. 100-51 12 29 1200 (133-6-8 on oof Fuc-133-6-8 /en ap. 30 27 to heleengoto consers 37 (3) 20 60 (6 s. -54 The disc by the fare (6) doing dit of e of The state of the state of the state of e it ced pal, 9) 72 (8 d. ate. 72 1th (by (0) 13 3 cm / 147 6% roft many the straight of the way were ipal secretic of the state of the secretic secretic and in the first that the first of the first of the che Then Mathematik Halar Maschusel Meiorichen irf

## CHAP. XIV.

by the he Rule of Three Compos'd of Five Numbers.

THE Rule of Three Compos'd, is when Questions (wherein there are 5 Numbers given to find a thin Proportion thereunte) are resolved by one Single ale of Three compos'd of the 5 given Numbers.

2. When Questions may be perform'd by the Double ule of Three Direct and it is requir'd to refolve them y the Rule of Three Compos'd; first order or rank your lumbers according to the 7th Rule of the 12th Chaper; then.

Multiply the Terms or Numbers (that stand one over the other in the first place) the one by the other and make their Product the first Term in the Rule Three Direct; then multiply the Terms that stand one over the other, in the third place, and place their Paduct for the third Term, in the Rule of Three Direct and put the middle Term of the 3 uppermost for a second Term; then having found a fourth proportion

found shall be the Answer requir'd.

So the first Question of the 12th Chapter being propos'd, viz, If 100 l, in 12 Months gain 6 l. Interest.

onal direct to thefe three, this fourth proportional

what will 75 1 gain in 9 Months? The Numbers being rank'd (or plac'd) as is there directed and done.

Than I multiply the two first Terms, soo and 12 the one by the other, and their Product, is 1200 (for the first Term) then I multiply the two lasts Terms 75 and together, and their Product is 675 for the thir Term. Then I say, as 1200 is to 6, so is 675 to the

Answer, which by the Rule of Three Direct; will found to be 3 1.7 s. 6 d. as was before found.

3. But if the Question be to be answer'd by the Di ble Rule of Three Inverse, then (having placed the fi given Terms as before) multiply the lowermost Ten of the first place, by the uppermost Term of the thin place, and put the Product for the first Term; the multiply the Term of the third place, and put the Product for the third Term, and the fecond Term the three highest Numbers for the middle Term! those two; then if the Inverse proportion is found the uppermost three Numbers, the fourth proporti nal Direct to thefe three hall be the Answer. So the first Question to the 13th Chapter-being stated, wi If 100 ! principal in 12 Months gain 6 !. Interest what principal will gain 3 1. 7 1. 6 d. in 9 Months State the Numbers as is there directed in the fit Order, viz.

p. 14 Chap

Then reduce the 6 l. and 3 l 7 s. 6 d. into Pence, the 6 l. is 1440 d and 3 l. 7 s. 6 d is 801 d then multiply 1440 by 9, the Product is 12960 for the first Term in the Rule of Three Direct, and multiply 8 10 by 12, the Product is 9720, for the third Term; then I fay, as 12960 is to 139 l so is 9720 to the Answer, viz. 75 l is before But if the Terms had been placed after the second Order, viz.

Then the Inverse Proportion is found in the lowest Numbers, and having compos'd the Numbers for a Single Rule of Three, as in the second Rule foregoing; then the Answer must be found by a Single Rule of Three Inverse; for here it falls out to multiply 8,00 by 12 for the first Number, and 1440 by 9 for the third Number; and then you must say, As 9720 is to 100 l. so is 12960 to the Answer, which by Inverse Proportion will be found to be 75 l as before.

The Questions in the 12th and 13th Chapters may

erve for thy farther Experience.

pending between divers Persons having put together General-Stock, so that they may every Man have a proportional part of Gain, or sustain his proportion part of Los.

2. The Rule of Fellowship, is either Single, or it

Double.

1. The Single Rule is, when the Srocks propounds are fingle Numbers, without any respect or relation to Time, each Pastner continuing his Money in Stot

for the fame Time.

4. In the Single Rule of Fellowthip, the Proportion is, as the whole Stock of all the Partners is in Proportion to the total Gain or Lofs, fo is each Man's part cular Share in the Stock, to his particular Share in the Gain or Lofs. Therefore take the Total of all the Stocks for the first Term in the Rule of Three, in the whole Gain or Lofs for the fecond Term and the particular Stock of any one of the partners for the Term, then multiply and divide according to the 7th Rule of the 10th Chapter, and the fourth proportion Number is the particular Los or Gain of him whole Stock you made your second Number, wherefore re peat the Rule of Three as often as there are particular Stocks or partners in the Question, and the fourth Terms, produced upon the several Operations, are the respective Gain or Loss of those particular Stocks gi ven, as in the Examples following.

of Wine for 20 L of which A paid 12 L and B paid 1 L and they gain'd in the Sale thereof 5 L now I demand each Man's Share in the Gains according to his Stock

them together, viz. 12 l. and 8 l.
which are 20 l. then according to 12
this Rule, I say first, if 20 l. (the 8
Sum of their Stock) require 5 l.
the total Gain, how much will 12 l. 20 l.
(the Stock of A) require? Multi-

ply and divide by the 7th Rule of the 9th Chapter, and the Answer is 3 L for the Share of A in the Gains;

Single Fellowship. hap. TS. ins : then again I fay, If 30 1. require \$ 1. What 1 8 1. require? The Answer is 2 1. which is the in of B. So I conclude thes the Share of A in the in is 3 L and the Share of B in c ill is 5 l.

Total

2. In the Double Rule of Fellowship, multiply each parular Stock by its respective Time, and having added eseveral Products together, make their Sum the Mumber (or Term in the Rule of 3, and the total in or Lofs the fecond Number, and the Product of y one's particular Stock by his time, the third Term) the 4th Number in proportion thereunto is his nicular Gain or Lofs whose Product of Scock and me is your Third Number.

Then repeat (as in Single Fellowfbip) the Rule of 3, as en as there are Products or (Partners) and the ons thereby invented, are the Numbers required.

Example ..

Queft. 1. A and B enter Partnership; A put in 401. Months, B put in 70 1. for 4 Months, and they

Stock and Time, and the Sum 125 420. Then by the Rule of Three Direct, I fay, As 420 (the Sum of the Product is to 70

146

the Total Gain) so is 120 (the Product of A li Stock and Time) to 20 1. (the Share of A in the Gains. Then I say again, As 420 is to 70, so is 300 to sel The Share of B in the Gains.) And fo much ough

each to have for his Share.

Queft. 2. A, B and C make a Stock for 12 Month A put in at first 364 1 and 4 Months after that he put in 40 l. B put in at first 408 l. and at the End of Months he took out 86 1. C put in at first 148 1, and 3 Months after he put in S6 1. more, and 5 Months after that he put in 100 l. more, and at the End of it Months their Gan is found to be 14361. I defire to know each Man's Share in the Gains, according to his Sock and Time?

First, I confider that the whole Time of their Park nership is 12 Months. Then I proceed to find out the Leveral Products, or Stock and Time as followeth:

A had at first 364 1. for 4 Months ? wherefore there Product is, Then he put in 40 l. which with the first Sum makes 404 1. which continued

the remainder of the Time, viz. 81 Months, and their Product is,

The Sum of the Products of the Stock and Time of A is,

As

-As the Sum of the Simples to be mingled is to the sotal Value of all the Simples, so is any Part or Quantity of the Composition or Mixture to its mean Race or Price.

Quef. 1. A Farmer mingled 20 Bushels of Wheat at 5, per Bushel, and 36 Bushels of Rye at 3, per Bushel, with 40 Bushels of Barley at 2, per Bushel; now I defire to know, what one Bushel of that Mixture

is worth?

To resolve this Question, add together the given Quantities, and their Values, which is 96 Bushels, whose total Value is 14 l. 8 n. as appeareth by the Work following; For,

Bush.

20 of Wheat at 5 s. per Bushel, is 5—0
36 of Rye at 3 s. per Bushel, is 5—8
40 of Barley at 2 s. per Bushel, is 4—0

The Sum of their given quantities, is

Then fay, by the Rule of Three Direct, If 96 Bushels cost (or is worth 14 1. 8 s.) what is I Bushel worth?

96, and their Value is. -

bush. 1. s. bush.

96—14—8—1

20

94) 288 (3 s.

288 Facit, 3.1. per Bufbel.

Quest. 2. A Vintner mingleth 15 Gallons of Canary at 8 s. per Gallon, with 20 Gallons of Malaga, at 7 s. 4 d. per Gallon, with 10 Gallons of Malaga, at 6 s. 0 d. per Gallon, and 24 Gallons of White wine at 4 s. per Gallon; now I demand what a Gallon of this Mixture is worth? Work as in the last Question, and you wild find the Answer to be 6 s. 2 d. 2 grs 45.

Quest 3. A Grocer hath mingled 3 C. of Sugarat 56 s per C. with 3 C. of Sugar at 3 l. 14 s. 8 d. per C. and with 6 C. at 1 l. 17 s. 4 d. per C. I defire to know the price of a hundred Weight of that Mixture?

Answer, 21. 13 s. 1 d 77

3. The Proof of this Operation, is by the Price of any quantity of the Mixture to find The Proof of out the total Value of the whole Composition, and if it is equal to the Total Value of the feveral Simples, the Work is right; otherwise not. As in the first France.

Work is right; otherwise not. As in the first Example, the Answer to the question was, That 3 s. is the price of 1 Bushel; wherefore I say, by the Rule of Proportion, If 1 Bushel be 3 s. what is 95 Bushels? Answer, 14 l. 8 s. which is the total Value of the several Simples; Wherefore the Work is right.

## CHAP. XVIII.

# Alligation Alternate.

1. A LLIGATION ALTERNATE, is, when there are given the particular Prices of feveral Simples, and thereby we discover such Quantities of these Simples, as being mingled together, shall bear a certain Rate propounded.

2. When such a Question is stated, place the given Prices of the Simples one over the other, and the propounded Price of the Composition against them in such fort that it may represent a Root, and they as so many Branches springing from it, as in the following Examp.

thels of Wheat at 5 s. or 60 d. per Bushel, with Rye at 3 s or 3s. 6 d. per Bushel, and With Barley at 2 s or 24 d. per Bushel, and Oats at 1 s. 6 d. per Bushel, and desireta to mix such a Quantity of Rye, Barley and Oats with the 20 Bushels of Wheat, as that the whole Composition may be worth 2 s. 8 d. or 32 d. per Bushel.

The

The Prices of the Simples being placed according to the last Rule (with the Price of the Composition proounded as a Root to them) will stand as followeth.

( 60 Pence

1. Having thus placed the given Numbers, you are to link or combine the feveral Rates of the Simples the one othe other, by certain Arches in fuch fort that one that is leffer than the Root (or mean Rate) may be links ed or coupled to another that is greater than the mean. Rate, to the Question last propounded will stand

4. Then take the Difference between the Root and he several Branches, and place the Difference of each gainst the Number or Branch with which it is coupled or linked, and having taken all the Differences and placed them as aforefaid, then those Differences fo placed will shew you the Number of each Simple to be taken to make a Composition to bear the mean Rate propounded.

So the Branches of the last Question being linked to-

gether, as in the first Manner, I ly, the Difference between 32 ind 60 is 28, which I put aminst 18, because 60 is linked with 18, then the Difference beween 32 and 36 is 4, which I

put against 24 because 36 is link'd or coupled with 14 then I say, the Difference between 32 and 24 is 14 which I place against 36 (for the Reason aforesist then I say, the Difference between 32 and 18 is 14 which I place against 60; and then the Work will stand

as you fee in the Margent.

So I conclude that a Composition made of 14 Bushels of Wheat at 60 d per Bushel, and 8 Bushels of Rye at 36 d. per Bushel, and 4 Bushels of Barley at 24 d. per Bushel, and 28 Bushels of Oats at 18 d. per Bushel, will bear the mean price of 32 d. or 25. 8 d. per Bushel. And here observe, That in the Composition there is but 14 Bushels of Wheat; but I would mingle 20 Bushels, and this Kind, (or rather Case) of Alligation Alternate, (viz) when there is given a certain Quantity of one of the Simples, and the Quantities of the rest sought to mingle with this given Quantity, (that the Whole may bear a Price propounded) is at led Alternation Partial.

And the Proportion to find out the several Quantities to be mingled with the given Quantity, is as fol-

loweth, viz

As the Difference annexed to the Branch, that is the Value of an Integer of the given Quantity is to the other particular Differences, so is the Quantity

given to the feveral Quantities required.

So here, to find out how much Rye, Barley, and Oats, must be mingled with the 20 Bushels of Wheat, I say, by the Single Rule of Three Direct is 14 Bushels of Wheat require 8 Bushels of Rye, what will 20 Bushels of Wheat require? Answer, 17-6 Bushels of Rye.

Again, If 14 Bushels of Wheat require 4 Bushels of Barley, what will 20 Bushels of Wheat require? Answ. 542 Bushels of Barley. Again, I say, If 14 Bushels of Wheat require 28 Bushels of Oats, what will 20 Bushels of Wheat require? Answer, 40 Bushels of Oats.

And now I say, that 20 Bushels of Wheat mingled with 11-4 Bushels of Rye, and 513 Bushels of Barley, and 40 Bushels of Oats, each bearing the Rate as aforesaid, will make a Composition or Heap of Corn, that may yield 32 d per Bushel.

But if the Branches had been coupled according to the second Order or Manner, the Differences would have been thus placed, viz. the

have been thus placed, viz. the Difference between 32 and 60 is 28, which I fet against 24 be cause 60 is linked thereto; and the Differences between 32 and 36 is 4, which I set against 18,

and the Difference between 32 and 24 is 8, which I for against 60; then the Difference between 32 and 18 is 14, which I set against his Yoke-fellow 36, and then I conclude, that if you mix 8 Bushels of Wheat with 14 Bushels of Rye, 28 Bushels of Barley, and 4 Bushels of Oats, each bearing the aforesaid Prices, the whole Mixture may be sold for 32 d. per Bushel, as by the Work in the Margant

Work in the Margent.

arley, aforethat But

le.

You see by this Work we have found how many Bushels of Rye, Barley and Oats, ought to be mixed with 8 Bushels of Wheat, and to find out how many of each ought to be mixt with 20 Bushels of Wheat, I say, as 8 is to 14, so is 20 to 35 Bushels of Rye. As 8 is to 28, so is 20 to 70 Bushels of Barley. As 8 is to 4, so is 20 to 10 Bushels of Oats, whereby I conclude, that if to 20 Bushels of Wheat I put 35 Bushels of Rye, 70 Bushels of Barley, and 10 Bushels of Oats, bearing each the aforesaid price per Bushel, that then a Bushel of this Mixture will be worth 32 d. or 21.8 d.

And if the Branches had been linked as you fee in the third place where each Branch bigger than the Root is linked to two that are leffer than the Root, then in this Cafe you must have placed the feveral Differences between the Root and Branches, against those two with which each is coupled, as first, the Difference between 12 and 60 is 28; which I set against 24 and 18, because of the second secon

cause it is coupled.

$$3^{2} \begin{cases} 60 \\ 56 \\ 28 \end{cases} \qquad \begin{vmatrix} 8 \\ 8 \\ 14 \\ 28 \end{vmatrix} \begin{vmatrix} 22 \\ 4 \\ 32 \\ 4 \end{vmatrix} \begin{vmatrix} 32 \\ 32 \\$$

with

Lastly, I draw a Line behind the Differences, an add the Differences which fland against each Branch and put the Sum behind the faid Line against its pro-

32 and 18 is 14, which I put against 60 and 36, the

per Branch, as you see in the Margent.

And now by this Work, I find that 22 Bushels of Wheat mingled with 22 Bushels of Rye, and 32 Bush els of Barley, and 32 Bushels of Oats, each bearing the faid price, will make a Mixture bearing the mean me of 32 d. per Bushel.

And to find how much of each of the rest must be

mingled with 20 Bushels of Wheat, I say,

As 22 is to 22, so is 20 to 20 Bushels of Rye. A 22 is to 32, fo is 20 is to 29-3 Bushels of Barley. As 21 is to 32, fo is 20 to 29 2 Bushels of Oats.

Whereby you fee the Questions of Alligation Alter nate, will admit of more true Answers than one; for we have found three several Answers to this find

Question.

154

Yoke fellow of 18.

Questions of Alternation Partial are prov'd the fame Way with Questions in Aligatin Medial, which you may fee in the The Proof of Al-3d Rule of the 17th Chapter. ternation Partial.

Queft. 2. A Gracer hath 4 Sorts of Sugar, viz. of 12 d. per l. of 10d per l. of 6 d. per l and of 4 d per. I. and would have a Composition worth 8 d. per 1. the whole Quantity whereof should contain 144 / made of these 4 Sorts, I demand how much of each he must rake.

Questions of this Nature are resolv'd by that put of Alligation Alternate, call'd by Arithmeticians, Alies nation Total, viz. where there is given the Sum and Prices of feveral Simples to find out how much ofeach Simple ought to be taken to make the faid Sum of

quantity, To that I may bear a certain Rate pro-

To resolve this Question, I place the several Prices : fihe Simples and mean Rate propounded, and link em together, as is directed in the ad and 3d Rules of is Chapter, and place the Differences between the oot and Branches, according to the 4th Rule of this hapter, which will then fland one of thefe 3 Ways, viz.

Second. Third.

s. Then add the feveral Differences together, which have done, and the Sums of the first and second Orlet are 12 1. and of the third 24 1. as you may fee above. But it is required that there should be 144 /. of the Composition, therefore to find the Quantity of each simple to make the whole Composition 144 ?. Observe this general Rule, -viz.

As the Sum of the Differences is to the feveral Difbrences, fo is the rotal Quantity of the Compession othe Quantity of each Simple.

So to find how much of each Sort of Sugar I oughe to take to make 144 l. at 8 d. per l. I fay,

As 12 is to 4, fo is 144 to 48 h at 12 d per l. As 12 is to 2, fo is 144 to 141. at 10 d. per l. As 12 is to 2, fo is 144 to 24 l. at 6d. per l, As 12 is to 4, to is 144 to 48 / at 4 d. per &

Chap, 1 Whereby I find that 48 1. at 12 d. per l. and 241 10 d. per l. and 24 l. at 6 d. per l. and 48 l. at 4 d, per

G

m

per

an

fi

h

fo

m

I

B

21

10

will make a Composition of Sugar containing 144 worth 8 d. per 1.

But as the Branches are link'd in the fecond Orde the Answer will be 24 l. at 12 d. per l. and 48 l. at 10 per 1. and 48 1. at 6 d. per 1. and 24 1. at 4 d per 1. make the faid Quantity, and to bear the faid Price

And if you had worked as the Branches are link after the third Order, then you would have found it

Quantity of 36 l. of each.

Quest. 3. A Vinter hath 4 Sorts of Wine, viz. Canar at 10 s. per Gallon, Malaga at 8 s. per Gallon, Rheniff wine at 6 s. per Gallon, and White-wine at 4 s. per Gi ion, and he is minded to make a Composition of the all of 60 Gallons, that may be worth 5 s. per Gallon defire to know how much of each he must have?

The Number of Terms being rank'd according to the fecond Rule of this Chapter, the Branches will be link as followeth; but will admit of no other Manne of coupling, because there is but one Branch that leffer than the Root; thereof all the rest must be

link'd unto it; and the Differences between the Root and the three first Branches, viz. 10, 8, and 6, which are 5, 3,

(10

and I must be fet against 4, because they are coupled with it, and the Diff terence between the Root (viz.) 5 and 4, which is 1 must be fet against the 3 other, because it is linked to them all; fo I find I Gallon of Canary, I Gallon of Malaga, 1 Gallon of Rhenish-wine, and 9 Gallons of White-wine, prized as above, being mingled together will be worth 5 s. per Gallon, the Sum being 12 Gallons but there must be 60 Gallons; wherefore I fay,

As 12 is to 1, fo is 60 to 5 Gallons of Canary. As 12 is to 1, fo is 60 to 5 Gallons of Malaga. As 12 is to 1, fo is 60 to 5 Gallons of Rhenil. As 12 is to 9, fo is 60 to 45 Gal. of White-wine 241

More Ways may be given for the alligating or linking of the Terms in this Question, but these are sufficient for the Industrious. And it shall also suffice to give an Answer to the Question as the Terms are link'd the first Way, not doubting but the ingenious Practitioner will be able at his leisure to find Answers to the other 3 Ways, wiz.

As 56 is to 17, fo is 28 to 8-10 of 24 As 56 is to 2, fo is 28 to 10-00 of 22

As 56 is to 19 fe is 28 to 9--10 of 20

As 56 is to 18 so is 28 to 4-00 of 15 As 56 is to 10 so is 28 to 5-00 of alloy.

Thus much well practifed and understood, is suf-

The Proof of Althe Answer is given true when the sernation Total.
Sum of each of the Quantities of Simples found, agrees with the Sum or

Quantity propounded, as in the last Question the Answer was 8 oz. 10 p. w. of 24 Carects fine, 10 oz. of 22 Carects fine, 9 oz. 10 p. w. of 20 Carects fine, 4 of 15 Carects fine, and 5 oz. of Alloy, which added together makes 28 oz. the Quantity propounded.

### CHAP. XIX.

Reduction of Vulgar Fractions.

HAT a Vulgar Fraction is, and its parts and feveral Kinds, hath been already thewed in

the 19, 20, 21, 12, 23, 24 and 31 Definitions of the fift Chapter of this Book, which the Learner is de-

fired diligently to observe before he proceeds.

2. To reduce a Vulgar Fraction (which discovereth the principal Knowledge of Fractions, and therefore ought greatly to be regarded) we shall discover plain ly under these Eight several Heads (or Rules) following viz.

1. To reduce a Mixt Number into an Improper

h.

H.

to c'd

ti.

he

uf.

tal, the

in. or

In.

15

her

nd

in

the

2. To reduce a Whole Number into an Improper Fraction.

1. To reduce an Improper Fraction into its equiva-

lent Whole, (or Mixt) Number.

4. To reduce a Fraction into the lowest Terms equivalent to the Fraction given.

. To find the Value of a Fraction in the known

Parts of Coyn, Weight, Measure, Or.

6. To reduce a Compound Fraction to a Simple one

of the same Value.

7. To reduce divers Fractions having unequal Denominators, to Fractions of the same Value, having an equal Denominator.

8. To reduce a Fraction of one Denomination to

another of the same Value.

1. To reduce a Mint Number to an Improper Fraction.

The Rule is,

Vide Chap. 1.

Defin. 31. Multiply the Integer Part or (whole Number) by the Denominator f the Fraction, and to the Product add the Numerator, and that Sum place over the Denominator for a new Numerator, fo this new Fraction shall be equal to the next Number given. As for Example.

1 Reduce 184 into an Improper Fraction, multiply the whole Number 18 by 7 the Denominator, and to the Product add the Numerator 3, the Sum is 1:0, which put over the Denominator 7, and it makes 14".

for the Answer as followeth.

7

184

129

facit

2. Reduce 183 to an improper Fraction facit, 111.
3. Reduce 502 to an improper Fraction facit, 111.

II. To reduce a Whole Number into an Improper Fraction.

The Rule is,

Multiply the given Number by the intended Denominator, and place the Vide Chap 1. Product for the Numerator overt it. Defin. 23.

As for Example

160

whose Denominator shall be 12. To
effect which I multiply 15 by the
intended Denominator (12) the Product is 180, which I place over 12 as
a Numerator, and it makes 180 which facit, 180 is equal to 15 as was required; as per
Margent.

2 Reduce 36 into an Improper Fraction, whose De nominator shall be 26 facit, 936

3 Reduce 135 into an Improper Fraction, whole Denominator shall be 16 Facit, 3160

III. To reduce an Improper Fraction into its Equivalent
- Whole or Mint Number.

The Rule is,

Divide the Numerator by the Denominator, and the Quotient is the Whole Number equal to the Fraction, and if any thing remain, put it for a Numerator over the Divisor. Example.

I. Ro

1. Reduce 446 into its equivalent mixt Number. Divide the Numerator 446 by the Denominator 8, and the Quotient is 54, and 4 remains, which put for a Numerator over the Divisor 8, the Answer is 542, as followeth,

8) 436 (54

40 26 F

36. Facit, 5,4

...

2. Reduce 1476 to a mixt Number, facit, 23171.

IV. To reduce a Fraction into its lowest Terms equivalent to the Fraction given.

The Rule is,

1. If the Numerator and Denominator are even Numbers, take half the one and half of the other as often as may be, and when either of them falls out to be an odd Number, then divide them by any Number that you can discover will divide both Numerator and Denominator without any Remainder; and when you have thus proceeded as low as you can reduce them, then this new Fraction so found out, shall be the Fraction you defire, and will be in Value equal to the given Fraction.

1. Let it be required to reduce 191 into its lowest Terms. First I take

the half of the Nume192 | 96 | 48 | 24 | 12 | 44
rator 192, and it is 96,
336 | 168 | 84 | 42 | 27 | 12
then half of the De-

nominator, and it is 168, so that now it is brought to  $\frac{94}{161}$ , and next to  $\frac{48}{14}$ , and by halfing still, to  $\frac{14}{14}$  and their half is  $\frac{1}{12}$ , and now I can no longer half it because 21 is an odd Number, wherefore I try to divide them by 3, 4, 5, 6, &c. and I find 3 divides them both without any Remainder, and brings them to  $\frac{4}{1}$ , as per Margent.

1101

tion.

op 1.

tion'

12

180

De\*

ose

lent

on,

la

So I conclude 4 thus found, to be equal in Value to the given Fractions 323.

2. What is 1038 in its lowest Terms? Answer, 1.
3. What is 1144 in its lowest Terms? Answer, 1.

There is yet another Way more excellent than the former, to reduce a Fraction into its

Vid. Ought. Cla. lowest Terms, and that is by finding Matth. cap. 7. a common Measure, viz the greatest Number that will divide the Nume.

rator and Denominator without any Remainder, and by that Means reduce a Fraction to its lowest Terms at the first Work; and to find out this common Measure. divide the Denominator by the Numerator, and if any thing remains, divide your Divisor thereby; and if any thing yet remain, then divide your last Divisor by it; do so until you find nothing remaining; then this last Divisor shall be your greatest common Measurer, which will divide both Numerator and Denominator, and reduce them both into their lowest Terms at one Work.

Example.

4. Reduce 228 into its lowest Terms by a common Measurer; to effect which I divide the Denominator 304 by the Numerator 228, and there remains 76, then I divide 228 (the first Divisor) by 76 (the Remainder) and it quotes 3, and nothing remains; wherefore the Jast Divisor 76 is the common Measurer; by which I divide the Numerator of the given Fraction, viz 278, it quotes 3 for a new Numerator, then I divide the Denominator 304 by 76, and it quotes 4 for a new Denominator, so that now I have found 3 equal to 3284.

5. Reduce 3 48 into its lowest Terms by a com-

mon Measurer, Facit,  $\frac{9}{12}$ 6. Reduce  $\frac{3}{2} \cdot \frac{8}{3 \cdot 8}$  into its lowest Terms by a common Measurer, Facit, 35.

A Compendium.

Note, That if the Numerator and Denominator of a Fraction, and each with a Cypher or Cyphers, then cut off as many Cyphers from the one as from the other. and the remaining Figures will be a Fraction of the same Value, viz. 3405 will be found to be reduced to 170

Mu inferi the fa vide t pives by, a

by cutting off the two Cyphers from the Numerator and Denominator with a Dash of the Pen thus,  $\frac{14}{7}$ ,  $\frac{4}{10}$ ,  $\frac{6}{7}$ , will be  $\frac{46}{7}$ , thus,  $\frac{46}{7}$ , &c.

V. To find the Value of a Fraction in the known Parts of Coyn, Weights, &c.

The Rule is,

Multiply the Numerator by the Parts of the next inferior Denomination that are equal to an Unit of the same Denomination with the Fraction; then divide that Product by the Denominator, and the Quote gives you its Value is the same Parts you multiply'd by, and if any Thing remain, multiply it by the Parts of the next inferior Denomination, and divide as before; do so, till you can bring it no lower, and the several Quotients will give you the Value of the Fraction as was requir'd; and if any Thing at last resmain, place it for a Numerator over the former Denominator. Some new Examples will make the Rule plain.

1. What is the Value of  $\frac{27}{29}$  1. Sterling? To answer this Question, I multiply the Numerator 27 by 20, (the Shillings in a Pound) the Product is 540, which I divide by 29 (the Denominator) and the Quotient is 18 s. and there remains 18, which I multiply by 12 Pence, and the Product (216) I divide by the Denominator 29, the Quotient is 7 d. and 13 remains, which I multiply by 4 Farthings, the Product is 52, which I still divide by 29 the Quotient is 1 Farthing, and there remaineth 23, which I put for a Numerator over the Denominator 29, so I find the Value of  $\frac{27}{15}$  1. to be 18 s. 7 d. 1 qr.  $\frac{23}{19}$ , as by the following Operation; and after the same Manner are the Values of the Fractions in the several Examples following found out.

VI. To reduce a Compound Fraction to a simple One of the

What a Compound Fraction is, hath been shewn in hip 1. Definition 24 and to reduce it to a Simple action of the same Value,

#### The Rule is,

Multiply the Numerators continually, and place the Product for a new Numerator, then multiply the nominator continually, and place the last Product a new Denominator. So this single Fraction shall equal to the Compound Fraction. Example.

Reduce ? of ? of ? to a Simple Fraction.

Multiply the Numerators 2, 3, and 5 together, they
ke 30 for a new Numerator; then I multiply the
mominators 3, 5 and 8 together, and their Product
120 for a Denominator, so the Simple Fraction is
and cutting off the Cyphers, it is ?, equal to
by the Fourth Rule following.

5 3 15 8 5	and the second				
3 15 8 6 5				A STATE OF THE SAME	
3 15 8 6 5					100

Example.

4. What is the Value of 3 of 5 of 15 of a Pound

VII. To reduce Fractions of emequal Denominators of Fractions of the same Value, having equal Denominators.

#### The Rule is,

Multiply all the Denominators together, and the Product shall be the common Denominator. Then multiply each Numerator into all the Denominators, except its own, and the last Product put for a Numerator over the Denominator, found out as before: So this new Fraction is equal to that Fraction, whose Numerator you multiply'd into the said Denominators. Dose by all the Numerators given, and you have your Desire.

#### Example.

Multiply the Denominators 4, 5, 6 and 8 together continually, and put the Products 960 for the common Denominator; then multiply the Numerator 3 into the Denominators 5, 6, and 8, and the product is 720, which is a Numerator to 960 (found as before) fo 210 is equal to the first Fraction 3; then I proceed to finds new Numerator to the second Fraction; viz. 3, and I multiply 4 (into all the Denominators except its own viz ) into 4,6, and 8, which produceth 26 equal to 1 then multiply the Numerator s into the Denominators 4, 5, and 8, the product is 100 equal to . Then multiply the Numerator 7 into the Denominators 4, 5, and 6, the Product is \$40 equal to 7 and the Work is done; so that for 305 and 7 I have 340 568 100 and 340

nator, facium 3756, 2738 and 3744.

VIII. A

VIII. To reduce a Frastion of one Denomination to another.

1. This is either Ascending or Descending. Ascendwhen a Fraction of a smaller is brought to a great-Denomination; Descending, when a Fraction of a

mester Denomination is brought lower.

1. When a Fraction is to be brought from a leffer to greater Denomination, then make of it a Compound nation, by comparing it with the intermediate Deominations between it and that you would have it duced to, then (by the 6th Rule foregoing) reduce our Compound to a Single Fraction, and the Work done. Example.

Queft. r. It is requiree to know what part of a ound Sterling of a Penny is?

To resolve this, I consider that I d. is is of a Shilng, and a Shilling is 10 of a Pound; wherefore 5 d. fof i of of a Pound, which by the faid 6th Rule find to be Tor of a Pound Sterling of English Money.

Queft. 2. What part of a Pound Troy-weight is 4 of a enny-weight? Answer, 4 of 1 of 1 lequal to 1,41

3. When a Fraction is to be brought from a greater a leffer Denomination, then multiply the Numeraor by the parts contain'd in the feveral Denominations etwixt it, and the parts you would reduce it to; then hee the last Product over the Denominator of the iven Fraction. Exemple.

Queft. 3. I would reduce ? 1. to the Fraction of a tnny; to do which, I multiply the Numerator 3 by and 12, the Product is 720, which I put over the Penominator 5, it makes 750 of a Penny, equal to \$1.

Queft. 4. What parts of an Ounce Troy is 18? An-100, 15 ox.

## CHAP. XX.

# Addition of Vulgar Fractions.

I. I F your Fractions to be added have a common Denominator, then add all the Numerators together, and place their Sum for a Numerator to the common Denominator, which new Fraction is the Sum of all the given Fractions; and if it be improper, reduce it to a whole or mixt Number, by the 3d Rule of the anoth Chapter.

The Denominators are equal, viz. every one is 24, wherefore add the Numerators together, viz. 7, 9, 16, and 14, their Sum is 46, which put over the Denomitor 24, it makes \(\frac{46}{24}\) the Sum of the given Fractions, which will be reduced to the mixt Numbers 1\(\frac{2}{24}\), or

111.

Denominators, then reduce them to a common Denominator by the 7th Rule of the 19th Chapter, and then add the Numerators together, and put the Sum over the common Denominator, &c. as before in the last Example.

Quest 2. What is the Sum of  $\frac{3}{5}$ ,  $\frac{7}{4}$ ,  $\frac{9}{15}$ , and  $\frac{1}{15}$ ? The Fractions reduced to a common Denominator are  $\frac{2880}{150}$ ,  $\frac{4300}{1500}$ ,  $\frac{4330}{1500}$ , and  $\frac{4400}{1500}$ , the Sum of their Numerators is 15800, which put over the common Denominator, makes  $\frac{15800}{1500}$ , or  $\frac{158}{1500}$  equal to the mixt Numerator, makes

ber 314, or 324 for the Sum required.

Queft. 3. What is the Sum of 17, 45, and 32? An.

Swer, 13755.

3. If you are to add mixt Numbers together, then add the Fractional Parts as before, and if their Sum be an Improper Fraction, reduce it to a mixt Number, and add its integral Part to the integral Parts of the given mixt Numbers, and the Work is done.

Quest. 4. What is the Sum of 13 4 and 241?

Firft,

Vulgar Fractions. Chap. 20. First add the Fractions 2 and 4 the Sum is 142, then d this Integer 1, to 13 and 24, their Sum is 78, and stafter it the Fraction ; it is 38 1 for the Answers ric is 38 +. Quef. 5. What is the Sum of 48 1, 64 1 and 130 3 ? lecit, 243 114, or 243 45. 4. If any of the Fractions to be added, is a Comand Fraction, it must first be reduced to a Simple nction by the 6th Rule of Chapter 19, and then add to the reft, according to the ad Rule of this Chapomm o t. Example. Queft. 6. What is the Sum 11, and 7 of 1 of ?? duce Reduce of of of into a Simple Fraction, and it is f the which reduced with the other two, and added. 47 10 145 36. Queft. 7. What is the Sum of !! and 3 of 4 of 1? \$ 24 9, 16, nwer, 112 f. If the Fractions to be added are not of one Deomimination, they must be so reduced, and then proions, , or ed as before. Queft. 8. What is the Sum of 3 1. and 5 1. ? Of the given Fractions here, one is of a Pound, and larps Deother the Fraction of a Shilling; and before you n add them together, you must reduce ? s. to the and nction of a Pound as the other is (by the 8th Rule Sum in the (Chapter 19) and it makes 13 1. then 3 and 13 1. ill be found to be 110 1. or 11 1. by the 7th Rule of 13.7 hipter 10, and in its lowest Terms 121, by the th Rule of Chapter 19. or are It would have been the fame if (by the latter part umethe 8th Rule of Chapter 19) you had reduced 3 14 10811the Fraction of a Shilling; which you would have Vumand to have been 2, which added to 1, by the id 17th Rule of the last Chapter, the Sum is 15 1. ? An. hich is equal to the Sum found, as before, vizi r (by the 5th Rule of Chapter 19) the value of. then ill be found to be 15 1. 10 d. and fo will 15 1. 2 be um be and to be just as much. mber, tre gi-Firft,

CHAP XXI

Subtraction of Vulgar Fractions.

HE Rules in Addition for reducing the give Fractions to one Denomination, are here t be observed; for before Subtraction can be made, the Fractions must be reduc'd to a Common Denominator then subtract one Numerator from the other, and place the Remainder over a Common Denominator, which Fraction shall be the Excess or Difference between the given Fraction. Examples.

Queft. 1. What is the Difference between } and ! The given Fractions are reduced to 11 and 14 the fuberact the Numerator 20 from the Numerator 11 and there remains I, which being put over the Deno minator 28, makes if for the Answer or Difference

between } and 4.

Queft. 2. What is the Difference between & and fof4 Reduce the Compound Fraction & of to a Simple Fraction, then proceed as before, and the Answer I

the equal to \$2.

2. When a Fraction is given to be subtracted from a Whole Number, Subtract the Numerator from the Denominator, and put the Remainder for a Numers or to the given Denominator, and fubtract an Unit for that you borrow'd) from the Whole Number, an the Remainder place before the Fraction found, as be fore, which mix'd Number is the Remainder or Dif ference fought. Example.

Queft. 3. Subtract - from 48

infwer, 47 to; for if you lubtract 7 (the Numerator from 10 (the Denominator) there remains 3, which put ever 10 is + and 1 (I borrow'd) from 48 refts 47 to which joyn to, and it makes 47 to for the Excellent

Queft. 4. Subtract +1 from 17, remains 56 1.

excels

If it be required to subtract a Fraction from a set Number, or one mixt Number from another, rescetthe Fraction, to a Common Denominator, and if a Fraction to be subtracted be selfer than the other, an subtract the selfer Numerator from the greater, and that is a Numerator for the common Denominator, then subtract the selfer Integral part from the reater, and the Remainder with the remaining Fraction thereto annexed is the Difference required between the two given mixt Numbers. Example.

Such s. Subtract 26 f from 54 f.

First, Subtract 4, viz. 37 from 4, viz. 11, the Reminder is 17, then 26 from 54, remainerh 28, to hich annex 17 it makes 28 17 for the Answer.

But if the Fraction to be subtracted is greater than a Fraction from whence you subtract, then having the reduc'd the Fractions to a Common Denominator, he the Numerator of the greatest Fraction out of the thominator, and add the Remainder to the Numerator of the lesser Fraction, and their Sum is a new Numerator to the Common Denominator, which Fraction see, then (for the 1 you borrow'd) add 1 to the ingral part to be subtracted, and subtract it from the enter Number, and to the Remainder annex the action you noted before, so this new mixt Number all be the Difference sought. Example.

The Fractions reduc'd are, viz. 2 equal ro 1, and 3 and 10 1 now I should subtract 1 from 1, but I mot, therefore I subtract 21 from 28, rests 7, which ded to 16 (the lesser Numerator) makes 23 for a unerator, to 28, viz. 1; then I come to the integral its 14 and 29, and say, I that I borrow'd and 14 is which taken from 29, there rests 14, to which aning 1 it is 14 1 for the Remainder or Difference tween 14 2 and 29 1.

legh 7. Subtract 36 78 from 74 4, facit. 37 34

## CHAP. XXII.

# Multiplication of Vulgar Fractions.

The Multiplicand and Multiplier are Simple (or Single) Fractions, then multiply the Numerators together for a new Numerator, and the Denominators for a new Denominator, and the new Fraction is the Product required.

Quest. r. What is the Product of hy ?? Facit, for the Numerators 5 and 9 being multiply'd, make 45, and the Denominators 7 and 11, being multiply'

make 77.

Quest. 2. What is the Product of \( \frac{1}{2} \) by \( \frac{2}{37} \)? \( \frac{1}{2} \) is the Fractions to be multiply'd be mixt Numbers, reduce them to Improper Fractions by the in Rule of the 19th Chapter; then proceed as before.

The given mixt Numbers being reduc'd to Improper Fractions are 48? equal to 24, and 13 2 equal to 4, now 23 multiply'd by 3, according to their Rule of this Chapter, produceth 2212, or 672 12.

Quel. 4. What is the Product of 430 16 by 184

Facit, 11474 or 7935 14

3. If a Compound Fraction is to be multiply'd by Simple Fraction, first reduce the Compound Fraction into a Simple Fraction, then multiply the one by the other, as is taught above.

Queft 5. What is the Product of \$\frac{1}{2}\$ by \$\frac{3}{2}\$ of \$\frac{1}{2}\$ of \$\frac{1

its lowest Term is to for the Answer.

And if the Multiplicand and Multiplier are bot Compound Fractions, reduce them both to Simplones, then multiply these new Fractions as before, you have the Product.

Quest. 7. What is the Product of 3 of 3 by 4 of 1

Unit prope fore.

## OHAP. XXIV.

the Rule of Three Direct in Vulger Fractions.

A S in the Rule of Three in Whole Numbers, fo likewise in Fractions, you must see that the factions of the first and third places be of the same Denomination.

2. See that if any of the given Fractions be Comjound, that they be reduced to Simple of the fame Value.

3. If there are given mix'd Numbers, reduce them to improper Fractions by the 1st Rule of Chap. 19.

4. If any of the three Terms is a Whole Number, make it an improper Fraction by constituting an Unit for its Denominator.

Having reduced your Fraction as is directed in the bur last Rules, then proceed to a Resolution, which is performed the fame way as in Whole Numbers, respect being had to the Rules deliver'd for the working of Fractions, viz. Multiply the 2d and 3d Fractions together according to the rft Rule of Ch. 22. and divide the Product by the 1st Fraction, according to the 1st Rule of Chap. 27. and the Quotient is the Answer.

Or. (which is better) 5. Multiply the Numerator of the first Fraction into the Denominator of the second and third, and the Product is a new Denominator, then multiply the Denominator of the ift Fraction into the Numerator of the second and third, and the Product is a new Numerator, which new Fraction is the 4th Proportional or Answer, which (if it be an Improper Fraction) must be reduced to s whole or mix'd Number by the 3d Rule of Chap. 19. Examples.

Yards of Cloth coft & l. what will Queft. I. If

To Yards coft ? Having placed the given Fractions according to the 6th Rule of Chap. 10. I proceed to the Refolution, and full I multiply the Numerator of the Aft Fraction (3)

ESI

360 SE 15 573 at 132 8 3-62 22-14-2 facit facis 4-2-62 485 Lat 2 ad. \$20 yds. at 7 3 80-10 d. 65 9 0-117 161. 5 s. facit. 41, 10 1. 1124 644 at 2 d. 137 yds, at 10 5 d. 68 --- 6 d. 17-134 27-1 d. 119-10 = 4. 13/6-3 61. 16 1. 3 d. gl. 19 1. 10 1 d. far.

11. When the price of the Integer is a then cut off the Figure in the place of Units of the given Num-

ber, and double it for Shillings, and the Figures on the other hand are Pounds. Example, 436 Yards at 21 per Yard, out off the last Figure 6 and 43 6

Cafe. 4.

double it, it makes 12 Shillings, and the other two Figures, viz. 43 are fo many 43 l. 12 h Pounds; so that their Value is 43 1. 12 se as per Masgent. 12. Hence

6.

lum-

n the

12%

Lence

12. Hence it is evident that when the given price of an Integer is an even Number of Shillings, then if you take half of that (even) Number of Shillings, and multiply the given Number of Integers thereby, donbling the first Figure of the Product, and fetting it aport for Shillings, the rest of the Product will be Pounds, which Pounds and Shillings are the Value fought. Example: What coft \$36 Yards at 8 : per ad? To resolve which I take tof 8 s. (the price of a Yard) which is 4, and multiply 536 thereby, lying, 4 times 6 is 24, then I double 536 yds. at ?; the first Figure 4 makes 8 for Shillings, and carry a to the next Product, or I find the rest of the Product to be 214, which I note for Pounds, fo the Value of 536 rds. at 8 s. peryd. is 214 l. 8 J. as per Margent. More Eximples follow.

56 yd. at 6 s. per yd.	420 yds. at 12 s. per yd.
16 f. 16 s. facit.	252 L. facie.
123 yd s.at 4 s. per yd.	326 yds at 14 a pergd.

601.-10 s. facit.

16. When the given value of the Integer is Shillings and Pence, and not an even part of a Pound, yet many times it may be divided into parts (viz. 6 s. 6 d. is 4 s. and 20. 6 d. for the 41. Work according to the 14th Rule foregoing, and for the 25.6 d. take the eighth part of the given Number, and add them together, then their Sum is the Value required)

So 81.6d. will be divided into 61. and 21.6d. and the price of the given Number may be found out as he-

fore, &c. Examples follow:

yds. s. ells s. d. 286 at 8-8 540 at 5-4 128 / - 13-4 38 - 12-5 54-01. 90-0% 167 1. 5 s. 4d. facit. 144 1. facit. ells: s. d. yds. s. .d. s. 427 at 8-6 286 at 14-8 6 1281 -2-0 1541 8-0 53-7-6 128-13-4 2831. 1 s. 4 d. facit. 181 1. 9.4. 6 d' facit. 17. When

Chap

hings

17. When the given price of an Integer is Shillings and Pence, and you cannot readily divide them according to the last Rule, then multiply the given Number, whose Value you seek, by the Number of Shillings in the price of the Integer, and then for the Pence work by the 8th Rule foregoing; then add the Numbers together, and their Sun is the Value fought in Shillings: as for Example, What is the Value of 302 vds at 6; o d. per yd. Here 6 a. o.d. cannot be made an even part. nor indeed can it be divided into even parts of a Pound; wherefore I multiply the given Number of yds 192 by 6, for the 6s the Produkt is 2352 Shillings, then for the o.d. I divide it into 6d. and a d. and work for 'em by the 8th Rule foregoing, and at last add the Shillings together, they make 2646 s. and by the 3d Rule they are reduced to 132 1.6; the Value of 392 yds, at 6 1 0 d. per Yard. See the Work following.

			392 at 6-9

Many more Questions might be stated, and several other Rules of Practice may be flewn, according to the Method of divers Authors; but what have been deliwred here, are sufficient for the Practical Arithmetician in all Cases whatsoever.

### C H A P. XXVII.

## The Rule of Barter:

DARTER, is a Rule among Merchants, which (in the Exchanging of one Commodity for anther) informs them so to proportion their Rates, that neither may fustain Loss.

2. To resolve Questions in Barter, it will not be difficult to him that is acquainted with the Golden Rule, or Rule of Three, it being altogether used in re-

olving fuch Questions.

Queft. 1. Two Merchants (viz. A and B) Barter A hath 13 C: 3 grs. 14 1. of Pepper, at 2 1. 16 s. per C. nd B hath Cotton at 9 d. per l. I demand how much Cotton B must give A for his Pepper?

Answer, QC. I gr.

First find by the Rule of Three, or the Rules of actice foregoing, how much the Pepper is worth. lying,

If 1 C. cost 21. 16 s. what will 13 C. 3 gr. 141.

C. Toft?

Map

Secondly, By the Rule of Three, fay, If 9 d. buy 1 l.

10 f Cotton, how much will 38 l. 17 s. buy?

Answer, 94 C. and so much Cotton must B give to A or 13 C 3 grs. 14 l. of Pepper, at 2 l. 16 s. per Cent. then the Cotton is worth 9 d. per l.

Cha

Quest. 2. Two Merchants (A and B) Barter, A hath Ginger worth 1 l. 17 s. 4 d. per C. but in Barter he will have 2 l. 16 s. per C. B hath Nutmegs worth 5l. 12s.per C. now I demand how B must rate his Nutmegs per C, to make his Gain in Barter equal to that of A?

Anfwer, 8 1. 8 s.

Say by the Rule of Three, If 1 1. 17 s. 4 d. require 11. 16 s. in the Barter, what will 5 l. require in Barter?

Facit, 8 1. 8 s.

Quest. 3. A and B Barter, A hath 120 Yards of Broad-Cloth, worth 6 s. per yd. out in Barter he will have 1 s. per yd. B hath Shalloon worth 4s. per yd. Now I demand how many Yards of Shalloon B must give A for his Broad-Cloth, making his Gain in Barter equal to that of A?

Answer, 180 Yards of Shalloon.

First (as in the last Question) find out how Bought to sell his Shalloon in Barter, viz. say, If 6 s. require 8 s. what will 4 s. require?

Answer, 5 s. 4 d.

Thus you see that B must sell his Shalloon in Barrer at 5 s. 4 d. If A sell his Broad-Cloth at 8 s. peryd.

It remaineth now to find how much Shalloon B must give for 120 Yards of Broad-Cloth, which after the same Method used to resolve the first question of this Chapter is found to be 180, and so many Yards of Shalloon must B give A for the 120 Yards of Broad-Cloth.

Queft. 4. A and B bartered, A had 14 C. of Sugar, worth 6 d per 1. for which B gave him 1 C. 3 qrs. of Cinnamon, I demand how B raced his Cinnamon per

Anfmer, 4 1. per 1.

Worth 37 1. 16 s. ready Money, but in Barter he hith 50 18 s. per Tun, and A giveth B 21 C. 2 qrs. 11 \{ 1. 6 \text{ Cinger for the 4 Tun of Brandy, I defire to know much B fold his Ginger in Barter per C. and how much it was worth in ready Money?

Quest. 7. A and B Barter: A hath 608 Yards of Broad-cloth, worth 14s. peryd. for which B giveth him 125 l. 12 s. ready Money, and \$5 C. 2 grs. 24 l. of Bees-wax, now I defire to know how he reckon'd his Wax per C.

Answer, 3 l. 10 s per Cent.

### CHAP. XXVIII.

Questions in Loss and Gain.

Quest: 1. A Merchant bought 436 Yards of Broad-Cloth for 8 s. 6 d per Yard, and selleth it again at 10 s. 4 d per Yard; now I desire to know how much he gain'd in the 536 Yards?

Aufwer, 39 1.12 5 4 d.

First, find out by the Rule of Three, or by Practice, how much the Cloth cost him at 8s. 6d. per Yard, which I find to be 185 l 6d. then by the same Rule find out, how much he sold it for, viz. 225 l. 5s. 4d. then subtract 185 l. 6s. which it cost him, from 225 l 5s. 4d. which he sold it for, and there remaineth 39 l. 19s. 4d. for his Gain in the Sale thereof.

wtherwise, it may sooner be resolv'd thus, first find out how much he gain'd per yd viz. Subtract 8 s. 6d. which he gave per yd. from 10 k. 4 d. which he sold it for per yd. the Remainder 1s. 10 d. for his Gain per yd.

V

1

If 1 yd. gain 1 s. 10 d. what will 436 yds gain? The Answer, by Practice or the Rule of Three, is 39 l. 19 s. 4d. as was found before.

Quest 2. A Draper bought 124 yds. of Holland. Cloth, for which he gave 31 l. I desire to know how he must sell it peryd to gain 10 l. 6 s. 8 d. in the whole Sale of the 124 Yards? Answer, At 6 s. 8 d. per Yard.

Add the price which it cost him (viz. 311) to his intended Gain, (viz. 101.6s. 8d) the Sum is 411.6s. 8d. Then say,

If 124 yds require 41 l 6 s. 8 d. what will 1 yd. require? By the Rule of Three, I find the Answer, 6 s 8 d.

Quest. 3. A Grocer bought 3 C. 1 gr. 14 l of Cloves, which cost him 2 s. 4 d per l. and fold them for 52 l, 14 s. I desire to know how much he gain'd in the whole? Answer, 8 l. 12 s.

Quest. 3. A Draper bought 86 Kerseys for 129 l. I demand how he must sell them per Piece to gain 15 l. in laying out 100 l. at that Rate? Answer, 1 l. 14 s.

6 d. per Piece ; for,

As 100 1: is to 115 1. fo is 129 1. to 148 1. 7 s.

So that by the Proportion above, I have found how much he must receive for the 86 Kerseys to gain after the rate of 15 l. per C. Then to find how he must sell them per piece, I say,

As 86 Pieces are to 148 1. 7 s. fo is I Piece to 11.

14 s. 6 d. which is the Number fought.

Quest. 5. A Grocer bought  $4\frac{1}{4}$  C. of Pepper for 151. 17 s. 4d. and (it proving to be damnify'd) is willing to lose 12 l. 10 s. per Cent. I demand how he must sell it per l.? Answer, 7 d. per l.

Subtract 12 l. 10 s. the Loss of 100 l. from 100 l. and

there remains 87 1. 10 s. Then fay,

As 100 l. is to 87 l. 10 s. fo is 15 l 17 s. 4 d to 13 l.
17 s. 8 d fo much as he must sell it all for, to lose after
the Rate propounded: Then to know how he must
fell it per l. I say,

As 13 l. 17 s. 6 d. is to 4\frac{1}{4} C. so is 1 l. to 7 d.

Queft. 6. A Plummer sold 10 Fodder of Lead (the Fodder containing 191 C) for 2041. 15 s. and gain'd after the Rate of 12 l 10 s. per 100 l. I demand how. much it cost him per C? Answer, 18 s. 8 d.

To resolve this Question, add 12 1 10 s. (the Gain per Cent.) to 100 l. and it makes 112 l. 10 s. then

iay,

8

he

west.

As 112 1. 101. is to 100 1. fo is 204 1. 15 1. to

182 l.

Which 182 1, is the Sum it cost him in all; then reduce your 10 Fodders to half Hundreds, and it makes 390. Then fay,

As 390 half Hundreds is to 1821 fo is 2 half Hundreds to 18 s & d. the price of 2 half Hundreds, or one C. Weight, and so much it flood him in per C.

Weight.

Quest. 7. A Merchant bought 8 Tun of Wine, which being Sophifficated, he felleth for 400 l and leseth after the Rate of 12 L in receiving 100 L. Now I demand how much it cost him per Tun & april how he selleth it per Gallon to lose after the faid Rate? Answer, It cost 56 1. per Tun, and he must fell it at 3 1. 11 d. 210 grs. per Gallon to lofe 12 l. in receiving 100 %

To resolve this Question, I consider that in the first place, that in receiving 100 l he loseth 12 l therefore 100 L comes in for 112 l. laid out; wherefore to find out how much he laid out for the whole I fay,

As 100 l. is to 1121 so is 400 l. to 4481 and somuch the 8 Tun cost him.: Then to find how much it cost

per Tun, I fay,

As 8 is to 448 1. so is 1 to 561, the price it cost

per Tun.

Now to find how he must fell it per Gallon, reduce the 8 Tuns into Gallons, they make 2016. Then lay,

As 2016 Gallons is to 400 l fo is I Gallon to 3 1. II d. 21 grs. the price he must fell it at per Gallon to.

lose as aforefaid.

K 4

Que!

Quest. 8. A Merchant bought 8 Tuns of Wine, by its hich being sophisticated, he is willing to Sell for

Chap

fthe 7

the T

paid a 6 Mo and h

of the

20

which being fophisticated, he is willing to Sell for 400 l. and loseth at that Rate 12 l. in laying out 100 l. upon the same, now I demand how much it cost him per Tun?

Here I consider that for 100 l. laid out, he received but 88 l. wherefore to find what 8 Tuns cost him

I fay,

As 88 l. is to 100 l. fo is 400 l. to 454 the Price it all cost him, then to find how much per Tun, I say,

As 8 is to 454 of fo is 1 to 56 or 56 l. 16 s. 4d.

### CHAP. XXIX.

# Equation of Payments.

Quation of Payments is that Rule amongst Merchants whereby we reduce the Times for Payments of several Sums of Money to an equated Time for Payment of the whole Debt, without Damage to Debtor or Creditor; and,

#### The Rule is,

2. Multiply the Sums of each particular Payment by its respective Time, then add the several Products together, and their Sum divide by the Total Debt, and the Quotient thence arising, is the Equated Time for the Payment of the whole Debt. Example.

Quest. 1. A is indebted to B in the Sum of 130 l. whereof 50 l. is to be paid at 2 Months, and 50 l. at 4 Months, and the rest at 6 Months, now they agree to make one Payment of the Total Sum, the Question is, What is the Equated Time for Payment, without

Damage to Debtor or Creditor?

60

and the w

Inter

Mone is paidue a therw

In Mone 2 Mo or 2

To

Chap. 29: Equation of Payments.

To resolve this Question, I multiply each Payment by its Time, viz.

50 l. Multiply'd by 2 Mon. produceth

50 l. Multiply'd by 4 Mon. produceth

50 l. Multiply'd by 6 Mon. produceth

The Sum of the Product, is —480

Then I divide 480 (the Sum of the product) by 130 (the Total Debt) and the quotient is 3-1 Months for the Time of paying that whole Debt.

Quest. 2. A Merchant hath owing him 1000 l. to be paid as followeth, viz. 600 i. at 4 Months, 200 l. at 6 Months, and the rest (which is 200 l. at 12 Months,

600 l. Multiply'd by 4 Months is \_\_\_\_\_\_2400
200 l. Multiply'd by 6 Months is \_\_\_\_\_\_1200
200 l. Multiply'd by 12 Months is \_\_\_\_\_\_2400

and he agreeth with his Debtor to make one payment of the whole, I demand the Time of payment with-

The Sum of the Product is 6000

and the Sum of the products (6000) being divided by the whole Debt (1000 l. quotes 6 Months for the Time of payment of the whole Debt.

3, The Truth of this Rule is thus manifest, if the

Interest of that Money which is paid

out Damage to Debtor or Creditor?

(by the equated Time) after it is The Proof of the due, be equal to the Interest of that Rule of Equations Money (which by the equated Time) of Payments.

is paid so much sooner than it is

due at any Rate per C. then the Operation is true, otherwise not. Example.

In the last Quest. 600 l. should have been paid at 4. Months, but is not discharged till 6 Months, (chat is 2 Months after it is all due) wherefore its Interest or 2 Months at 6 per Cen. per Ann. is 6 l. and them.

K- 5

erayme to 200 l. was to be paid at 6 Months, which is the equated Time for its Payment, therefore no Interest is reckon'd for it; but 200 l. should have been paid at 2 Months, but is paid at 6 Months, which is 6 Months sooner than it ought, wherefore the Interest of 200 l for 6 Months, is 6 l. (accompting 6 l. per Gent. per Annum) which is equal to the Interest of 600 l. for 2 Months, wherefore the Work is right.

Quest. 3 A Merchant hath owing him a certain Sum to be discharg'd at 3 equal Payments, viz. \(\frac{1}{3}\) at two Months, \(\frac{1}{3}\) at four Months, and \(\frac{1}{3}\) at eight Months, the Question is, What is the equated Time for the Pay-

ment of the whole Debt?

In Questions of this Nature (viz. where the Debt is divided into equal or unequal Parts) each of its Parts is to be multiply'd by its Time, and the Sum of the Product is the Answer.

Multiply'd by 2 Mon. produceth 1/2 Multiply'd by 4 Mon. produceth 1/2 Multiply'd by 8 Mon. produceth 2/2

The Sum of the Product is 43

which is 43 Months for the equated Time of Payment If instead of the Fractions representing the Parts, you had wrought by the Numbers themselves (represented by those parts) according to the first and second Example, it would have been the same Answer; and suppose the Debt had been 90 l. then \(\frac{1}{3}\) of it is 30 l for each Payment; viz. at 2, 4, and 8 Months. Then

30 l Multiply'd by 2 Mon. produceth 60 30 l Multiply'd by 4 Mon. produceth 120 30 l. Multiply'd by 8 Mon. produceth 240

The Sum of the Product is 420

which divided by 90 (the whole Debt) quoteth 45% of 44 Months, rs before.

Then

Queft

In Questions of this Nature (viz. where there is ready Money paid) you are in multiplying to neglect the Money that is to be paid present, and work with the rest, as is before directed, and divide the Sum of the Products by the whole Debt, and the Quote is the Answer; for here 40 l. is to be paid present, and hath no Time allowed; and according to the Rule it should be multiply'd by its Time, which is (0); therefore 40 times 0 is 0, which neither augmenteth nor diminisheth the Dividend; wherefore to proceed (according to Direction) I say,

350 by 3 Months produceth --- 1050 250 by 8 Months produceth --- 2000

The Sum of the Product is 3050

which divided by 640, the whole Debt, the Quote is

442 Months, the Time of Payment.

Quest. 6. A is indebted to B in a certain Sum, half whereof is to be paid present Money, one third at 6 Months, and the rest at 8 Months, now I demand the equated Time for Payment of it all?

Answer, 31 Months is the Time of Payment.

Quest. 7. A is indebted to B 120 l. whereof is to be paid at 3 Months, at 6 Months, and the rest at 9 Months; what is the equated Time for the Payment of the whole Sum?

Answer,"

Answer, At 6 Months.

Quest. 8 A is indebted to B 420 1. which is due at the end of 6 Months, but A is willing to pay him 140 l. present, provided he can have the Remainder forborn so much the longer to make Satisfaction for his Kindness, which is agreed upon; I defire to know what Time ought to be allotted for the Payment of the 280 l. remaining?

To resolve this Question, First find out what is the Interest of 140 1. for the Time it was paid before it was due at 6 per Cent. or any other Rate (viz. 6 Months) and you will find it to be 41.4 s. Then it is evident that the remaining 280 l. must be detain'd so much Jonger than 6 Months, as the while it may eat out that Interest, viz. 41. 41. which is thus found out, viz. First, see what is the Interest of 280 1. for a Month, or any other Time; but here we will take one Month, and its Interest for one Month is 28 s.

Then by the Rule of Three, fay,

As 28 s. is to 1 Month, so is 84 s to 3 Months, so that the 280 l. remaining must be kept 3 Months, beyond its first Time of Payment (viz. 6 Months) which added thereto makes 9 Months, at the End of which Time A ought to make Payment of the Remainder.

### CHAP. XXX.

#### EXCHANGE.

HE Rule of Exchange informeth Merchants how to exchange Monies, Weights or Meafures of one Country into (or for) the Monies, Weights or Measures of another Country, and when the Rate, Reason or Proportion betwixt the Money, Weights or Measures of different Countries is known, it will not be difficult for the Practioner that is well-acquainted with the Rule for Proportion (or Rule of Three) to refolve any Question, wherein it is required

to ( the pari tric

ey,

n,

is

e of

ed

to

to exchange a given Quantity of the one Kind into the same Value of another Kind.

2. In Questions of Ezchange there is always a Comparison made between the Coyns, &c. of two Countries (or Kinds) or more.

3. In Questions where there is a Comparison made between two Things, (whether they be Monies, Weights, &c.) of different Kinds (or Countries) there may be a Solution found by a Single Rule of Three, as may appear by the following Example.

Queft. 1. A Merchant at London deliver'd 370 1. Sterling, to receive the same at Paris in French Crowns & the Exchange 3; French Crowns per Pound Sterling. I demand how many French Crowns he ought to receive?

In placing the Numbers, observe the 6th Rule of the 11th Chapter, which being done, the given Numbers will stand thus,

Crowns

 $-3\frac{1}{3}$ -370 and being reduced according to the Rules of the 12th Chapter will fland thus.

As  $\frac{1}{1}$  is to  $\frac{13}{3}$ , so is  $\frac{37}{1}$ ° to 1233.

So that I conclude he ought to receive 12333. French

Crowns at Paris for his 370 l. deliver'd at London.

Queft. 9. A Merchant deliver'd at Amsterdam 587 1. Flemish to receive the Value thereof at Naples in Ducats, the Exchange 43 Ducats per Flemish. I demand how many Ducats he ought to receive?

The Proportion is as followeth.

Ducats As 1 is to 34, fo is 5 17 to 28173.

So I find he ought to receive 2817? Ducats at Naples

for the 387 l. Flemish deliver'd at Amsterdam.

Quest. 3. A Merchant at Florence delivereth 2478 Ducatoons, to receive the Value at London in Pence, the Exchange at 53 Pence Sterling per Ducatoon; I demand how much Sterling he ought to receive? The

Ch

fore the

are W

and

fo. wh

> to m DA

don

R

is

lil

W

tl

The Proportion for Resolution is.

Duc. Duc. As  $\frac{1}{1}$  is to  $\frac{167}{3}$ , so is  $\frac{347}{1}$  to 186073.

which is equal to 775 1. 61 for the Answer.

I might here (according to the Custom of Arithme-trical Writers) lay down Taoles for the Reduction of Foreign Coyns into English; but by reason of their In-Stability (for they continue not at a constant Standard, as our Sterling Money doth; but are sometimes rais'd, and sometimes depress'd) I shall forbear.

4. When there is a Comparison made between more than two different Coyns, Weights or Measures, there ariseth ordinarily two different Cases from such a

Comparison.

1. When it is required to know how many Pieces of the first Coyn, Weight or Measure are equal in Vafue to a known Number of Pieces of the last Coyn, Weight or Measure.

2. When it is requir'd to find out how many Pieces of the last Coyn, Weight or Measure, are equal in Value to a given Number of the first Sort of Coyn, Weight or Measure.

### An Example of the Case may be this, Viz.

Queft. 4. If 150 Pence at London are equal to 3 Ducats at Naples, and 44 Ducats at Naples, make 342 Shilllings at Bruffels; then how many Pence at London are equal to 139 Shillings at Bruffels? Facit, 960 d.

The Question may be resolved by two Single Rules

of Three: For first, I fay,

If 3 Ducats at Naples make 150 d. at London, how many Pence will 44 Ducats make?

Anfwer, 240 d.

By the foregoing Proportion we have discover'd that 44 Ducats at Nuples make 240 Pence at London ;

1.

:5

e

C.

7

London; And by the Tenor of the Question we see that  $\frac{4}{7}$  Ducats at Venice main  $34\frac{1}{2}$  Shil. at Brussels, therefore 240 d. at London are equal to  $34\frac{1}{2}$  s. at Brussels, (for the Things that are equal to one and the same Thing are also equal to one another) wherefore we have a Way laid open to give a Solution to this Question by another Single Rule of Three, whose Proportion is,

As 34\frac{1}{2} Shillings at Bruffels is to 240 Pence at London, fo is 131 Shillings at Bruffels to 960 Pence at London;

which is the Answer to the Question.

An Example of the second Case, may be thus, viz.

Quest. 5. If 40 l. Averdupois-weight at London is equal to 36 l. Weight at Amsterdam, and 90 l. at Amsterdam makes 116 l. at Dantzick, then how many Pounds at Dantzick, are equal to 112 l. Averdupois-weight at London?

Answer 1293 1. at Dantzick.

This Question is likewise answered by two Single Rules of Three, viz. First I say,

As 36 l. at Amsterdam is to 40 l. at London. So is 90 l. at Amsterdam to 100 l. at London.

And by the Question you find that 901. at Amsterdamis 1161. at Dantzick; and therefore 1001. at London is likewise equal thereunto, where again I say,

As 100 l. at London is to 116 l. at Dantzick, So is 112 l. at London to 1221 l. at Dantzick;

By which I find that 1293 1. at Dantzick are equal

to 112 l. Averdupois-weight at London.

Questions as are contain'd under the two Cases before mentioned, laid down by Mr. Kersey, in the third Chapter of his Appendix to Wingate's Arithmerick, where he hath given two Rules for the Resolution of the Questions pertinent to the two said Cases.

6. But I shall lay down a general Rule for the Solution of both Cases; and first, Let the Learner observe the following Directions in placing of the given Terms.

viz.

Cha

fore

whe

geth

und

and 368

> Nu or

> viz.

out

cho

nor

fou

eith the

foll

fo

ber

the

nor

T

7. Let there be made two Columns, and in these Columns, fo place thr given Terms one over the other, as that in the same Column there may not be found two Terms of the same Kind one with the other.

Having thus placed the Terms, the general Rule is. Observe which of the said Columns hathithe most Terms placed in it, and multiply all the Terms therein continually, and place the last Froduct for a Dividend; then multiply the Terms in the other Column continually, and let the last Product be a Divisor, then divide the faid Dividend by the faid Divisor, and the Quotient thence arising is the Answer to the Question.

So the Example of the first of the said Cases being again repeated, viz. If 150 pence at london make three Ducats at Naples, and 45 Ducats at Naples make 342 Shillings at Bruffels, then how many pence at London are equal to 138 Shillings at Bruffels?

The Terms being placed according to the 7th Rule will stand as followeth.

Pence at Lond. 150 3 Ducats at Naples.

Ducats at Nap. 4 3 3 4 Shillings at Bruffels. Shill. at Bruff. 138 1

Having thus placed the Terms, that in neither Column there is two Terms of one Kind, then observe that the Column under A hath most Terms in it, therefore they must be multiply'd together for a Dividend, viz. 150 multiply'd by 45 produceth 3500, which multiply'd by 138, produceth 496800 for a Dividend, then in the Column under B there are 3, and 342. which multiply'd together, produce 207 for a Divisor, then having divided 496800 by 207 the Quotient is 960 pence for the Answer, as before.

Again, Let the Example of the second Case be again repeated, viz. If 40 l. Averdupois-weight at London make 36 1. Weight at Amsterdam, and 901 at Amsterdam make 116 at Dantzick, then how many pounds at Dantzick

are equal to 112 l. Averdupois-weight at London?

The

The Terms being dispos'd according to the 7th Rule foregoing, will stand thus,

l. at Lond.

l. at Amst.

A B

40 | 56 | l at Amsterdam.

90 | 116 | l. at Dantzick.

112 | l. at London.

whereby I find that the Terms under B multiply'd together produce 467712 for a Dividend, and the Terms under A, viz. 40 and 90 produce 3600 for a Divisor, and Division being finished, the Quotient giveth 129 2317 pounds Dantzick for the Answer

#### CHAP. XXXI.

# Single Position.

I. Egative Arithmetick, called the Rule of Falle, is that by which we find out a Truth, by Numbers invented or suppos'd, and this either Single or Double.

2. The Rule of Single position, is, when at once, viz. by one false position, or seign'd Number, we find

out the true Number fought.

3. In the Single Rule of False, when you have made choice of your position, work it according to the Tenor of the Question, as if it were the true Number sought, and if by the ordering your position you find either the Result too much or too little, you may then find out the Number sought by this proportion following, viz.

As the Refult of your position is to the proportion,

fo is the given Number fought.

Example.

Quest. 1. A Person having about him a certain Number of Crowns, said, If a Fourth, and third and sixth of them were added together they would make just 45%. now I demand the number of Crowns he had about him?

Answer, 60 Crowns.

To resolve this Question. I suppose he had 24 Crowns (or any other Number that will admit of the like Division) now the fourth of 24 is 6, and the third is 8, and the fixth is 4, all which parts, (viz. 6, 8 and 4) being added together, make but 18, but it should be 45, wherefore I say by the Rule of Three,

As 18 the Sum of the Parts is to the Position 24, so is 45 the given Number to 60, the true Number

fought.

For the fourth of 60 is 15, and the third of 60 is 20, and the fixth of 60 it 10. which added together make

45.

Quest. 2. Three Persons, viz. A,B, C, thus discourse together concerning their Age, quoth B to A, I am as old, and half as old again as you, then quoth C to B I am twice as old as you then quoth A to them, and I am sure the Sum of all our Ages is 165, now I demand each Man's Age? Answer, A 30, B 45, C 20 Years of Age, which added together, make 165.

## CHAP. XXXII.

Double Position.

Positions are assum'd to give a Resolution to the Question propounded.

2. When any Question is stated in Double Position,

make fuch a Cross as followeth.

3. Then make choice of any Number you think may be convenient for your working, which call your first Position, and place it at the End of the Cross at a then work with this Position, as if it were the true Number

10

true

mbe

Number fought, according to the Nature of your Queflion, then having found out your Error, either too much or too little, place it on that Side the Cross d, then make choice of another Number of the same Denomination with the first Position (which call your fecond Polition) and place it on that Side of the Crofs at b, then work with this Polition as with the former, and having found out your Error, either too much or too little, place it on that Side of the Crofs at c, and then the Politions will fland at the Top of the Cross, and the Errors in the Bottom, each under his correspondent Position; and then multiply the Errors into the Polition cross-wife, that is to fay multiply the first Position by the second Error, and the second Polition by the first Error, and put each Product over its Position.

4. Having proceeded so far, then consider whether the Errors were both alike; there is, whether they were both too much, or both too little, and if they are alike; then subtract the lesser Product from the greater, and set the Remainder for a Dividend, then subtract the lesser Error from the greater, and let the Remainder be a Divisor, then the Quotient arising by this Di-

vision, is the Answer to the Question.

5. But if the Errors are unlike, that is, one too much, and the other too little, then add the Products of the Positions and Errors together, and their Sum shall be a Dividend, then add the Errors together, and their Sum shall be a Divisor, and the Quotient arising hence is the Answer; which two last last Rules may be kept in Memory by this Verse following. viz.

When Errors are of unlinke Kinds Addition doth ensue, But if a like Subtraction finds Dividing Work for you.

Quest. 1. A, B and C built a House which cost 76 l. of which, A paid a certain Sum unknown, B paid as much.

much as A, and 10 l. over, and C paid as much as A and B; now I defire to know each Man's Share in that Charge?

Having made a Cross according to the second Rule, I come according to the third Rule to make choice of my first position, and here I suppose A paid 6 l. which I put upon the Cross as you see, then B paid 16 l. (for its said he had paid 10 l. more than A) and C paid 22 l. for its said he paid as much as A and B, then I add their parts.

1.	Section of the same make the t	1
9		A 6
19		B 16
28	120 168 288	B 16 C 22
56	2) \ (14	Sum 44
-4	32 2 1 20	
16		76
76. 56		-44
20		Error 32

And they amount to 44, but it is faid they paid 76 l. wherefore there is 32 too little, which I note down at the Bottom of the Cross under its position for the first Error.

Secondly, I suppose A paid 9 l. then B paid 19 l. and C 28 l. all which added together makes 56, but they should make 76, wherefore the Error of this Position is 20, which I put at the Bottom of the Cross under its Position for the second Error, then I multiply the Errors and Positions cross-wise, viz. 32 (the Error of the first Position) by 9 (the second Position) and the Product is 120.

Then (according to the 4th Rule) I subtract the lesser Product from the greater, viz. 120 from 288 because the Errors are both alike, (viz. too little, and

and the tract and the 168 b which

Chap

big, i lowin paid shoul Error

and there remaineth 168 for a Dividend, then I subtract 29, (the lesser Error) from 32, the greater Error, and the Remainder is 12, for a Divisor, then I divide 168 by 12, and the Quotient is 14 for the Answer, which is the Share of A in the Payment.

6. Again Secondly, if the Errors hath been both too big, it had had the same Effect as appeareth by the following Work; for first, I suppose A paid 20 l. then B paid 30 l. and C 50 l. which in all is 100 l. but it should have been no more than 76, wherefore the first Error is 24 too much. Again, I suppose A paid 18 l. then B must pay 28 l. and C must pay 46 l. which in all

24 Ferran	8	F 16
100 Sum 76 Subtr.	(8 X (14	Sum 92 Subtr. 76
50 C	320 112 432	C 46
10 A 30 B	(21)	A 18 B 28

is 92 l. but it should have been but 76 l. wherefore the second Error is 16 too much, then I multiply 20 (the first Position) by 16 (the second Error) and the Product is 320; again, I multiply 18 (the second Position) by 24 (the first Error) and the Product is 432. Then because the Errors are both too much, I subtract 320 (the lesser Product) from 432 (the greater Product) and there remaineth 112 for a Dividend; likewise I Subtract 16 (the lesser Error) from 33 (the greater Error) and the Difference is 8 for a Divisor, then perform Division, and Quotient is 14 (as before) for the Answer.

Again, Thirdly, if the Errors had been the one too big, and the other too little, respect being had to the fifth Rule foregoing, the Answer would have been the same; as thus, I take for my first Position 6, and then the Error is 32 too little, then I take for

my fecond Polition 18; and then the Error is 16 too much, then I multiply the Positions and Errors crosswife, and the products are 96 and 576, and because the Errors are unlike,

96 672 576

(viz.) one too big, and another too fittle, I add the Products 96 and 576, together, and their Sum is 672 for a Dividend; I likewise add the Errors 32 and 16 together, and their Sum is 48 for a Divisor, then having finish'd Division, I find the Quotient to be 14, which is the Answer as was found out at the 2 several Trials before.

> For Proof of the Work, I fay, 1. If A paid---Then B paid 14 and 10 (that is) -24 Then C paid 14 and 24 (that is) -38 The Sum of alis

which is the Total Value of the Building, and equal to

the given Number.

Those who defire to see the Demonstration of this Rule, let them read the 7th Chapter of Mr. Kerfey's Appendix to Mr. Wingate's Arithmetick, Petiscus in the 5th Book of his Trigonometria, or Mr. Oughtred in his Glavis Mathematica.

Queft. 2. Three Persons, A, B and C, thus discoursed together concerning their Age; quoth A I am 18 Years of Age; quoth B, I am as old as A and C; and quoth C, I am as old as you both, if your Years were added together. Now I defire to know the Age of each Person? Answer, A is 18, Bis 54, and C is Years of Age.

Quest. 3. A Father lying at the point of Death, to his 3 Sons, viz. A, B, C, all his Estate in Money and divideth it as followeth, viz. to A he gave - want ing 44 1. to B he gave + and 14 1. over, and to C he gave the Remainder, which was 82 1. less than the Share of B, now I demand what was the Sum Jeff and each Mans part? Answer, The Sum bequeathed was 588 1. whereof A had 250 1. B had 210 L and C had 128 /.

Quest. 4. Two Persons, viz. A and B had each in their Hands a certain number of Crowns, and A faid to B, If you give me one of your Crowns, I shall have times as many as you; and faid B to him again, if you give me one of yours, then we shall each of as have an equal Number; now I demand how many Crowns had each Person? Answer, A had 4, and B had two Crowns.

Queft. 5. What Number is that unto which if I add of it felf, and from the Sum subtract + of itself, the

Remainder will be 210? Answer, 192.

Many more Questions may be added, but these well understood, will be sufficient, (even for the Meanest Capacity) for the Resolution of any other Question pertinent to this Rule.

There may be an Objection made because we have not treated particularly upon Interest and Rebate, but the Operation of fuch Questions being more applicable to Decimals, are omitted, till we come to acquaint

the Learner therewith.

Advertisement.

Here is lately brought from Chili, a Province in America a most Excellent acural Balfam, far exceeding that of Peru d Tolu, in curing most Diseases in human dies; as it hath given Demonstration: 'Tis Remedy no Man under the Sun can come, as being a most Odoriferous and Natu-Balfam. It cures all Pains proceeding from old, corroborates the Stomach, creates an secite, and strengthens the whole Body: It a wonderful Remedy for all internal Sores, Bruifes, Ulcers, &c. and mightily helps all Athmatical Diftempers: 'Tis also a great Cehalick, helping most Diseases of the Head, ad firengthning the Brain and Nerves: It kills the Worms, provokes Urine, and is good against the Stone; helps all Fluxes of the Belly, is excellent in all Diseases of the Ears, especially Deafness: It also cures all manner of green Wounds.

Whereas the Balsam of Chili, has been Sold by Mr. Eben. Tracy, Bookseller, at the Three Bibles on London Bridge this Thirty Years last me, but since his Decease, Mr. John Stuart, tracioner, at the Three Bibles and Ink-Bottles, the Corner of the Square on London-Bridge, as made a Sham fort which is an Imposition

on he Publick.

Note. The right Sort is only to be had of the Edow Tracy, Brokfeller, at the Three Bibles of London-Bridge, at 18. 6d. the Ounce; the Dutter art Seal d with the Balfam-Tree. 35
